### Statement of Agency Compliance

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

### FCC Class B Compliance Statement

This equipment has been tested and found to comply with the limits for a Class B digital device pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

Reorient or relocate the receiving antenna.

- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio or television technician for help.

Caution: Any changes or modifications made to this device that are not expressly approved by Hand Held Products, Inc. may void the user's authority to operate the equipment.

Note: To maintain compliance with FCC Rules and Regulations, cables connected to this device must be shielded cables, in which the cable shield wire(s) have been grounded (tied) to the connector shell.

### Canadian Notice

This equipment does not exceed the Class B limits for radio noise emissions as described in the Radio Interference Regulations of the Canadian Department of Communications.

Le present appareil numerique n'emet pas de bruits radioelectriques depassant les limites applicables aux appareils numeriques de la classe B prescrites dans le Reglement sur le brouillage radioelectrique edicte par le ministere des Communications du Canada.

The CE mark on the product indicates that the system has been tested to and conforms with the provisions noted within the 89/336/ EEC Electromagnetic Compatibility Directive and the 73/23/EEC Low Voltage Directive.

#### Complies with:

EN55022:1998 (for ITE emissions)

EN55024:1998 (for ITE immunity), including CISPR 22B:1997

EN61000-4-2:1995 EN61000-4-3:1995

For further information please contact:

Hand Held Products, Inc. Nijverheidsweg 9 5627 BT Eindhoven The Netherlands

Hand Held Products, Inc. shall not be liable for use of our product with equipment (i.e., power supplies, personal computers, etc.) that is not CE marked and does not comply with the Low Voltage Directive.

### UL and cUL Statement

UL listed UL1950 and CSA 22.2 No.950. cUL listed UL1950 and CSA 22.2 No.950.

### LED Safety Statement

This device has been tested in accordance with EN60825-1 LED safety, and has been certified to be under the limits of a Class 1 LED device.

### Aimer Beam Safety Statement (Laser Aimer Option only)

This device has been tested in accordance with and complies with EN60825-1: 1994+A11+A2 and 21 CFR 1040.10 and 1040.11, except for deviations pursuant to Laser Notice No. 50, dated July 26, 2001.

LASER LIGHT, DO NOT STARE INTO BEAM, CLASS 2 LASER PRODUCT, 1.0 mW MAX OUTPUT: 650nM.

Caution: Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

### TÜV Statement

TÜV or GS marked to EN60950 and EN60825-1.

### C-Tick Statement

Conforms to AS/NZS 3548. C-Tick number: N10410.

### Mexico

#### **Patents**

Please refer to the IT4600/4800 packaging for a list of patents.

### Solids and Water Protection

The IT4600 has a rating of IP41, immunity of foreign particles and dripping water.

The IT4800 has a rating of IP54, immunity of windblown dust penetration and splashing water.

### For European Community Users

Note: Hand Held Products complies with Directive 2002/69/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 27 January 2003 on waste electrical and electronic equipment (WEEE).

### Waste Electrical and Electronic Equipment Information

This product has required the extraction and use of natural resources for its production. It may contain hazardous substances that could impact health and the environment, if not properly disposed.

In order to avoid the dissemination of those substances in our environment and to diminish the pressure on the natural resources, we encourage you to use the appropriate take-back systems for product disposal. Those systems will reuse or recycle most of the materials of the product you are disposing in a sound way.

The crossed out wheeled bin symbol informs you that the product should not be disposed of along with municipal waste and invites you to use the appropriate separate take-back systems for product disposal.

If you need more information on the collection, reuse, and recycling systems, please contact your local or regional waste administration.

You may also contact your supplier for more information on the environmental performances of this product.

# 1

### **Getting Started**

The IT4600 and 4800 have once again raised the bar for hand held area imager performance. Powered by Hand Held Products Adaptus™ Imaging Technology 5.0, the IT4600 and 4800 deliver aggressive read rates and depths of field on 1D, stacked linear, and matrix codes. This aggressiveness applies even in challenging reading environments where low lighting conditions and poor quality make it difficult to read bar codes. Adaptus Imaging Technology 5.0 ensures the product will provide outstanding imaging and bar code reading performance now and in the future.

Designed for today's demanding retail and commercial environments, the IT4600 offers superior image quality, speed, durability, and the ability to read all major bar code symbologies. The IT4600 is comfortable to hold, easy to use, rugged, and excellent for retail applications, as well as for all general scanning and imaging applications.

The IT4800 hand held industrial area imager is the first industrial class area imager powered by Adaptus Imaging Technology. The IT4800 has a similar ergonomic design as the IT4600, but has a more rugged housing, and is built to withstand the toughest industrial applications.

### About This Manual

This User's Guide provides installation and programming instructions for the IT4600/4800. Product specifications, dimensions, warranty, and customer support information are also included.

Hand Held Products' bar code imagers are factory programmed for the most common terminal and communications settings. If you need to change these settings, programming is accomplished by scanning the bar codes in this guide.

An asterisk (\*) next to an option indicates the default setting.

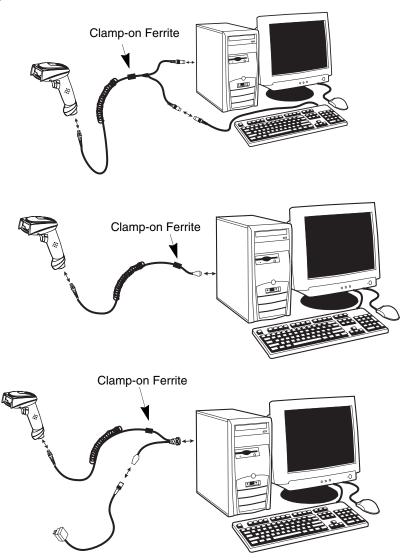

### Unpacking the Imager

After you open the shipping carton containing the IT4600/4800, take the following steps:

- Check for damage during shipment. Report damage immediately to the carrier who delivered the carton.
- · Make sure the items in the carton match your order.
- Save the shipping container for later storage or shipping.

### Clamp-on Ferrite Core Installation

It is important that you install the clamp-on ferrite included with your cable. *Installation of the ferrite is required to meet CE and FCC Class B emission requirements.* The following illustrations indicate where the ferrite should be placed on various cables.

### IT4600/4800 Models

There are three models of the IT4600/4800 imager, which may be used with many interfaces described in this manual. Refer to the chart below to determine the models that can be used with your interface.

The following interfaces apply to all IT4600/4800 focal distances and decoding options. Refer to Chapter 6 for programming information regarding secondary interfaces.

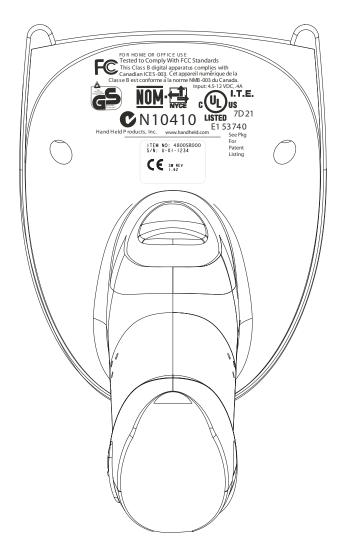

| Models                   | Primary   | Secondary                        |
|--------------------------|---|----------------------------------|
| 4600XX03XX<br>4800XX03XX | True RS-232   | True RS-232                      |
| 4600XX05XX<br>4800XX05XX | Keyboard wedge, TTL level<br>232, TTL level 232 serial<br>wedge, IBM 4683, wand emula-<br>tion, USB keyboard, USB HID,<br>USB retail (IBM SurePOS),<br>USB COM port emulation | Wand Emulation, TTL<br>level 232 |

### Laser Eye Safety Statement for IT4800 Series Engines

The IT4800 is intended for use in CDRH/IEC Class 2 devices.

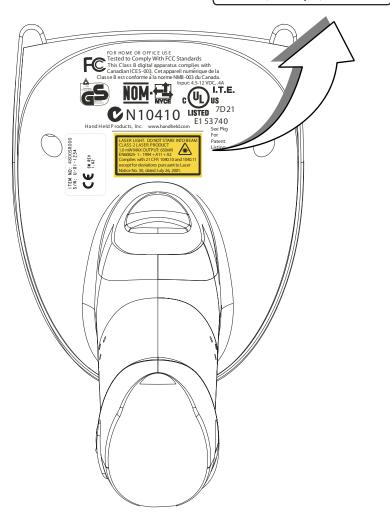

Note: It is the OEM manufacturer's responsibility to comply with applicable regulation(s) in regard to standards for specific equipment combinations.

# IT4600/4800 with Green LED Aimer Imager Identification

# IT4600/4800 with Red Laser Aimer Imager Identification

LASER LIGHT. DO NOT STARE INTO BEAM CLASS 2 LASER PRODUCT 1.0 mW MAX OUTPUT: 650nM EN60825-1: 1994 + A11 + A2 Complies with 21 CFR 1040.10 and 1040.11 except for deviations pursuant to Laser Notice No. 50, dated July 26, 2001.

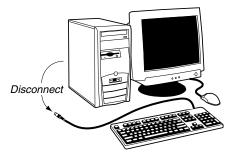

# Connecting the Imager When Powered by Host (Keyboard Wedge)

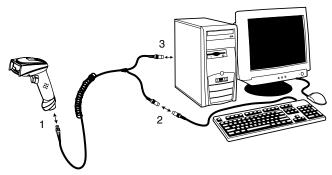

An imager can be connected between the keyboard and PC as a "keyboard wedge," plugged into the serial port, or connected to a portable data terminal in wand emulation or non decoded output mode. The following is an example of a keyboard wedge connection:

1. Turn off power to the terminal/computer.

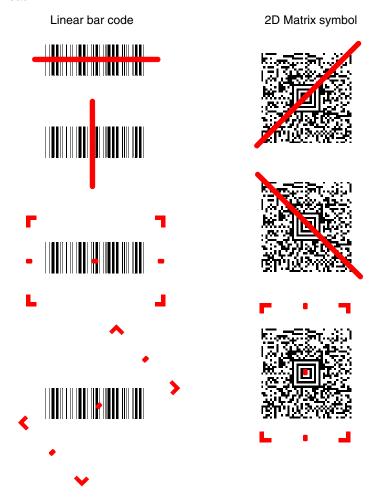

Connect the appropriate interface cable to the imager and to the terminal/ computer.

- 4. Turn the terminal/computer power back on. The imager beeps.
- 5. Verify the imager operation by scanning a bar code from the Sample Symbols in the back of this manual. The imager beeps once.

### Reading Techniques

The imager has a view finder that projects a bright red (available on IT4600 only) or green (available on both the IT4600 and IT4800) aiming beam that corresponds to the imager's horizontal field of view. The aiming beam should be centered over the bar code, but it can be positioned in any direction for a good read.

The aiming beam is smaller when the imager is closer to the code and larger when it is farther from the code. Symbologies with smaller bars or elements (mil size) should be read closer to the unit. Symbologies with larger bars or elements (mil size) should be read farther from the unit. To read single or multiple symbols

(on a page or on an object), hold the imager at an appropriate distance from the target, pull the trigger, and center the aiming beam on the symbol. If the code being scanned is highly reflective (e.g., laminated), it may be necessary to tilt the code  $\pm 5^{\circ}$  to prevent unwanted reflection.

### Plug and Play

Plug and Play bar codes provide instant imager set up for commonly used interfaces.

Note: After you scan one of the codes, power cycle the host terminal to have the interface in effect.

### Keyboard Wedge

Note: This interface applies to the 4600/4800SR050 model.

IT4600/4800 imagers are factory programmed for a keyboard wedge interface to an IBM PC AT with a USA keyboard. If this is your interface and you do not need to modify the settings, skip to Chapter 3 - Output.

If you programmed the imager for a different terminal interface and you want to change to an IBM PC AT and compatibles keyboard wedge interface, scan the bar code below.

IBM PC AT and Compatibles with CR suffix

### Laptop Direct Connect

Note: This interface applies to the 4600/4800SR050 model.

For most laptops, scanning the **Laptop Direct Connect** bar code allows operation of the scanner in parallel with the integral keyboard. The following Laptop Direct Connect bar code also programs a carriage return (CR) suffix, and turns on Emulate External Keyboard (page 2-7).

Laptop Direct Connect with CR suffix

### RS-232

The **RS-232** Interface bar code is used when connecting to the serial port of a PC or terminal. The following RS-232 Interface bar code also programs a carriage return (CR) and a line feed (LF) suffix, baud rate, and data format as indicated below:

Option Setting
Baud Rate 38400 bps

Data Format 8 data bits, no parity bit, 1 stop bit

RS-232 Interface

### Wand Emulation Plug & Play

Note: The Wand Emulation interfaces apply to the 4600/4800SR050 model.

In Wand Emulation mode, the imager decodes the bar code then sends data in the same format as a wand imager. The Code 39 Format converts all symbologies to Code 39.

The Same Code Format transmits UPC, EAN, Code 128 and Interleaved 2 of 5 without any changes, but converts all other symbologies to Code 39. 2D symbologies are converted to Code 128.

The *Wand Emulation Plug & Play Code 39 Format* bar code below sets the terminal ID to 61. The *Wand Emulation Plug & Play Same Code Format* bar code sets the terminal ID to 64. These Plug & Play bar codes also set the Transmission Rate to 25 inches per second, Output Polarity to black high, and Idle State to high. (If you want to change the terminal ID *only*, without changing any other imager settings, please refer to Wand Emulation Connection on page 2-13.)

Wand Emulation Plug & Play (Code 39 Format)

Wand Emulation Plug & Play Same Code

### IBM 4683 Ports 5B, 9B, and 17 Interface

Note: This interface applies to the 4600/4800SR050 model.

Scan one of the following "Plug and Play" codes to program the 4600/4800SR050 for IBM 4683 Port 5B, 9B, or 17.

Note: After scanning one of these codes, you must power cycle the cash register.

IBM 4683 Port 5B Interface

IBM 4683 Port 9B HHBCR-1 Interface

IBM 4683 Port 17 Interface

Each bar code above also programs the following suffixes for each symbology:

| <u>Symbology</u>   | <u>Suffix</u> |
|--------------------|---------------|
| EAN-8              | 0C            |
| EAN-13             | 16            |
| UPC-A              | 0D            |
| UPC-E              | 0A            |
| Code 39            | 00 0A 0B      |
| Interleaved 2 of 5 | 00 0D 0B      |
| Code 128           | 00 0A 0B      |
|                    |               |

IBM 4683 Port 9B HHBCR-2 Interface

The IBM 4683 Port 9B HHBCR-2 Interface bar code also programs the following suffixes for each symbology:

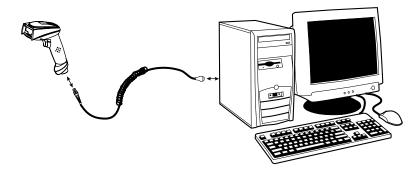

| <u>Symbology</u>   | <u>Suffix</u> |
|--------------------|---------------|
| EAN-8              | 0C            |
| EAN-13             | 16            |
| UPC-A              | 0D            |
| UPC-E              | 0A            |
| Code 39            | 00 0A 0B      |
| Interleaved 2 of 5 | 00 0D 0B      |
| Code 128           | 00 18 0B      |

### Connecting the Imager with USB

Note: This interface applies to the 4600/4800SR050 model only.

An imager can be connected to the USB port of a computer.

1. Connect the appropriate interface cable to the imager and to the computer.

- 2. The imager beeps.
- 3. Verify the imager operation by scanning a bar code from the Sample Symbols in the back of this manual.

Note: The following USB "Plug and Play" codes are supported on specific IT4600/4800 models. Refer to IT4600/4800 Models on page 1-3 to determine if this interface applies to your imager.

For additional USB programming and technical information, refer to Hand Held Products' "USB Application Note," available at www.handheld.com.

### IBM SurePos

Scan one of the following "Plug and Play" codes to program the IT4600/4800 for IBM SurePos (USB Hand Held imager) or IBM SurePos (USB Tabletop imager).

Note: After scanning one of these codes, you must power cycle the cash register.

IBM SurePos (USB Hand Held Imager) Interface

Each bar code above also programs the following suffixes for each symbology:

| <u>Symbology</u>   | <u>Suffix</u> |
|--------------------|---------------|
| EAN-8              | 0C            |
| EAN-13             | 16            |
| UPC-A              | 0D            |
| UPC-E              | 0A            |
| Code 39            | 00 0A 0B      |
| Interleaved 2 of 5 | 00 0D 0B      |
| Code 128           | 00 18 0B      |

Note: The following USB "Plug and Play" codes (USB Keyboard - PC, USB Keyboard - Mac, and USB HID) are supported on specific IT4600/4800 models. Refer to IT4600/4800 Models on page 1-3 to determine if this interface applies to your imager.

### USB PC or Macintosh® Keyboard

Scan one of the following codes to program the IT4600/4800 for USB PC Keyboard or USB Macintosh Keyboard. Scanning these codes adds a CR and selects the terminal ID (USB PC Keyboard - 124, USB Macintosh Keyboard - 125).

USB Keyboard (Mac)

### USB HID

Scan the following code to program the IT4600/4800 for USB HID bar code imagers. Scanning this code changes the terminal ID to 131.

USB HID Bar Code Imager

### USB COM Port Emulation

Scan the following code to program the IT4600/4800 to emulate a regular RS-232-based COM port. If you are using a Microsoft® Windows® PC, you will need to download a driver from the HHP website (www.handheld.com). The driver will use the next available COM port number. Apple® Macintosh computers recognize the imager as a USB CDC class device and automatically use a class driver. Scanning the code below changes the terminal ID to 130.

Note: No extra configuration (e.g., baud rate) is necessary.

#### CTS/RTS Emulation

### ACK/NAK Mode

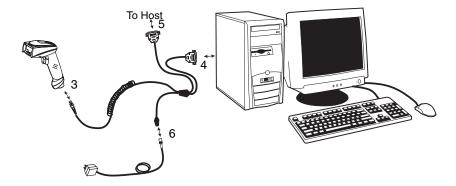

### Connecting the Imager with Serial Wedge

The IT4600/4800 uses True and TTL signal levels to wedge into an RS-232 serial network. Use only IT4600/4800 serial wedge cables to prevent damage to the imager. Refer to Connecting the Imager with RS-232 Serial Port on page 2-9 to set the baud rate and communications protocol.

- 1. Turn off power to the computer.
- 2. Disconnect the existing serial cable from the computer.
- 3. Connect the appropriate interface cable to the imager.

Note: For the imager to work properly, you must have the correct cable for your type of computer.

- Plug the serial connector into the serial port on your computer. Tighten the two screws to secure the connector to the port.
- 5. Plug the other serial connector into the host connection and tighten the two screws.
- 6. Plug the power pack cable into the receptor on the imager cable.
- 7. Plug the power pack into a power source.
- 8. Once the imager has been fully connected, power up the computer.

To set up the serial wedge terminal ID, use the serial terminal ID 050 and follow the instructions on page 2-1. Set the port to which you want the scanned data to transmit. Port 1 corresponds to P1 on the output cable and Port 2 corresponds to P2 on the output cable. Choosing Both sends scanned data to P1 and P2. Default = P1.

# 2

### **Terminal Interfaces**

### Terminal ID

If your interface is not a standard PC AT, refer to Supported Terminals on page 2-2 through page 2-3, and locate the Terminal ID number for your PC. Scan the **Terminal ID** bar code below, then scan the numeric bar code(s) from the Programming Chart inside the back cover of this manual to program the imager for your terminal ID. Scan **Save** to save your selection.

For example, an IBM AT terminal has a Terminal ID of 003. You would scan the **Terminal ID** bar code, then **0**, **0**, **3** from the Programming Chart inside the back cover of this manual, then **Save**. If you make an error while scanning the digits (before scanning Save), scan the **Discard** code on the Programming Chart, scan the **Terminal ID** bar code, scan the digits, and the **Save** code again.

Terminal ID

Save

Note: After scanning one of these codes, you must power cycle your computer.

## Supported Terminals

| <u>Terminal</u>   | Model(s)   | <u>Terminal</u><br><u>ID</u> |
|-------------------|--|------------------------------|
| DDC               | 3496, 3497, 122 key  | 005                          |
| DDC               | 3496, 3497, 102 key  | 071                          |
| DEC               | VT510, 520, 525 (PC style)   | 084                          |
| DEC               | VT510, 520, 525 (DEC style<br>LK411)   | 104                          |

<sup>\*</sup> Default for IT4600/4800-01 and IT4600/4800-05 models
\*\* Default for IT4600/4800-03 model (applies to IT4600/4800-03 models only)
\*\*\*Applies to IT4600/4800-05 model only. It is best to use the Plug and Play bar codes, beginning on page 1-8, to program these interfaces, rather than scanning the terminal ID listed in this table.

### **Keyboard Country**

Scan the appropriate country code below to program the keyboard for your country. As a general rule, the following characters are supported, but need special care for countries other than the United States:

@ | \$ # { } [ ] = / ' \ < > ~

\* United States

Canada (French)

Greece

Israel (Hebrew)

## **Keyboard Country (continued)**

Netherlands (Dutch)

Norway

Portugal

## **Keyboard Country (continued)**

Turkey F

Turkey Q

## Keyboard Style

This programs keyboard styles, such as Caps Lock and Shift Lock. *Default = Regular.* 

Regular is used when you normally have the Caps Lock key off.

\* Regular

Caps Lock is used when you normally have the Caps Lock key on.

Caps Lock

Shift Lock is used when you normally have the Shift Lock key on (not common to U.S. keyboards).

Shift Lock

**Automatic Caps Lock** is used if you change the Caps Lock key on and off. The software tracks and reflects if you have Caps Lock on or off (AT and PS/2 only). This selection can only be used with systems that have an LED which notes the Caps Lock status.

Automatic Caps Lock

Autocaps via NumLock bar code should be scanned in countries (e.g., Germany, France) where the Caps Lock key cannot be used to toggle Caps Lock. The NumLock option works similarly to the regular Auotcaps, but uses the NumLock key to retrieve the current state of the Caps Lock.

Autocaps via NumLock

Emulate External Keyboard should be scanned if you do not have an external keyboard (IBM AT or equivalent).

**Emulate External Keyboard** 

Note: After scanning the Emulate External Keyboard bar code, you must power cycle your computer.

## **Keyboard Modifiers**

This modifies special keyboard features, such as CTRL+ ASCII codes and Turbo Mode.

Control + ASCII Mode On: The imager sends key combinations for ASCII control characters for values 00-1F. Refer to Keyboard Function Relationships, page 10-1 for CTRL+ ASCII Values. Default = Off

Control + ASCII Mode On

**Turbo Mode:** The imager sends characters to a terminal faster. If the terminal drops characters, do not use Turbo Mode. Default = Off

**Numeric Keypad Mode:** Sends numeric characters as if entered from a numeric keypad. Default = Off

Numeric Keypad Mode On

\* Numeric Keypad Mode Off

**Automatic Direct Connect Mode:** This selection can be used if you have an IBM AT style terminal and the system is dropping characters. *Default = Off* 

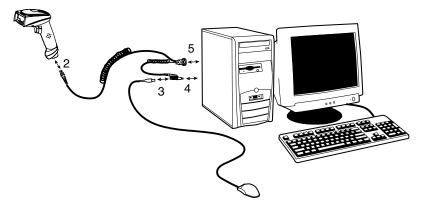

Automatic Direct Connect Mode On

## Connecting the Imager with RS-232 Serial Port

Note: These instructions are for use with the RS-232 power stealer cable.

- 1. Turn off power to the terminal/computer.
- 2. Connect the appropriate interface cable to the imager.

Note: For the imager to work properly, you must have the correct cable for your type of terminal/computer.

- 3. Unplug the mouse or keyboard from the computer. Plug the mouse or keyboard into the power tap on the imager cable.
- 4. Plug the power tap into the mouse or keyboard port.
- 5. Plug the serial connector into the serial port on your computer. Tighten the two screws to secure the connector to the port.
- 6. Once the imager has been fully connected, power up the computer.

All communication parameters between the imager and terminal must match for correct data transfer through the serial port using RS-232 protocol. Scanning the RS-232 interface bar code, programs the imager for an RS-232 interface at 38,400 baud, parity—none, 8 data bits, 1 stop bit, and adds a suffix of a CR LF.

**RS-232 Interface** 

#### RS-232 Baud Rate

Baud Rate sends the data from the imager to the terminal at the specified rate. The host terminal must be set for the same baud rate as the imager. Default = 38,400.

## RS-232 Word Length: Data Bits, Stop Bits, and Parity

Data Bits sets the word length at 7 or 8 bits of data per character. If an application requires only ASCII Hex characters 0 through 7F decimal (text, digits, and punctuation), select 7 data bits. For applications which require use of the full ASCII set, select 8 data bits per character. Default = 8.

**Stop Bits** sets the stop bits at 1 or 2. Default = 1.

**Parity** provides a means of checking character bit patterns for validity. Default = None.

7 Data, 1 Stop, Parity Even

7 Data, 1 Stop, Parity Odd

7 Data, 2 Stop Parity None

8 Data, 1 Stop, Parity Even

8 Data, 1 Stop, Parity Odd

7 Data, 1 Stop, Parity None

7 Data, 2 Stop, Parity Even

IT4600/4800 User's Guide

#### RS-232 Receiver Time-Out

The unit stays awake to receive data until the RS-232 Receiver Time-Out expires. A manual or serial trigger resets the time-out. When an RS-232 receiver is sleeping, a character may be sent to wake up the receiver and reset the time-out. A transaction on the CTS line will also wake up the receiver. The receiver takes 300 milliseconds to completely come up. Change the RS-232 receiver time-out by scanning the bar code below, then scanning digits from the inside back cover of this manual, then scanning Save. The range is 0 to 300 seconds. Default = 0 seconds (no time-out - always on).

RS-232 Receiver Time-Out

#### RS-232 Handshaking

RS-232 Handshaking allows control of data transmission from the Imager using software commands from the host device. When this feature is turned Off, no data flow control is used. When Data Flow Control is turned On, the host device suspends transmission by sending the XOFF character (DC3, hex 13) to the Imager. To resume transmission, the host sends the XON character (DC1, hex 11). Data transmission continues where it left off when XOFF was sent. Default = RTS/CTS, XON/XOFF and ACK/NAK Off.

RTS/CTS On

#### Wand Emulation Connection

The Wand Emulation Connection bar codes should be used if you want to change the terminal ID *only*, without changing any other imager settings. We recommend using Wand Emulation Plug & Play bar codes to program your imager to emulate a wand reader. The Wand Emulation Plug & Play bar codes change other parameters, in addition to changing the terminal ID. Please refer to Wand Emulation Plug & Play on page 1-9 for further information.

In Wand Emulation mode, the imager decodes the bar code then sends data in the same format as a wand imager. The Code 39 Format converts all symbologies to Code 39.

The Same Code Format transmits UPC, EAN, Code 128 and Interleaved 2 of 5 without any changes, but converts all other symbologies to Code 39. 2D symbologies are converted to Code 128.

The *Code 39 Format* bar code below sets the terminal ID to 61, and the *Same Code Format* bar code sets the terminal ID to 64. *Default = Code 39 Format*.

Code 39 Format

Same Code Format

#### Wand Emulation

Note: Changing primary wand emulation settings also changes the secondary wand emulation settings (see Secondary Code 39 Wand Emulation on page 6-2).

#### Data Block Size

This transmits the data in smaller blocks to prevent buffer overflow. Default = 40.

## Delay Between Blocks

This sets the delay time between data blocks. *Default = 50ms*.

#### Overall Checksum

When this option is turned on, a computed check character is added at the end of the entire message. The check character is the character which when Exclusive-OR'd with every preceding character of the message yields a result of 0x00 (00H). *Default = Off.* 

#### Wand Emulation Transmission Rate

The Transmission Rate is limited by the terminal's ability to receive data without dropping characters. *Default = 25 inches/second.* 

## Wand Emulation Polarity

The Polarity can be sent as standard with black bars high, or reversed with white bars high. *Default = Black High.* 

\* Black High

#### Wand Emulation Idle

The idle describes the state of the imager when no data is being transmitted. When in Wand Emulation mode, you must set the imager's idle state to match the idle state for the device to which the imager is connected. *Default = Idle High*.

\* Idle High

## 3 Output

#### **Good Read Indicators**

#### Beeper - Good Read

The beeper may be programmed On or Off in response to a good read. Turning this option off, only turns off the beeper response to a good read indication. All error and menu beeps are still audible. Default = On.

#### Beeper Volume - Good Read

The beeper volume codes modify the volume of the beep the imager emits on a good read. *Default = Medium for the IT4600, High for the IT4800.* 

Low

High

## Beeper Pitch - Good Read

The beeper pitch codes modify the pitch (frequency) of the beep the imager emits on a good read. Default = Medium.

## Beeper Duration - Good Read

The beeper duration codes modify the length of the beep the imager emits on a good read. Default = Normal.

\* Normal Beep

#### LED - Good Read

The LED indicator can be programmed *On* or *Off* in response to a good read. Default = On.

#### Number of Beeps - Good Read

The number of beeps of a good read can be programmed from 1 - 9. The same number of beeps will be applied to the beeper and LED in response to a good read. For example, if you program this option to have five beeps, there will be five beeps and five LED flashes in response to a good read. The beeps and LED flashes are in sync with one another. To change the number of beeps, scan the bar code below and then scan a digit (1-9) bar code and the *Save* bar code on the Programming Chart inside the back cover of this manual. Default = One.

Number of Pulses

## Good Read Delay

This sets the minimum amount of time before the imager can read another bar code. Default = No Delay.

\* No Delay

Short Delay (500 ms)

Medium Delay (1,000 ms)

Long Delay (1,500 ms)

## User-Specified Good Read Delay

If you want to set your own length for the good read delay, scan the bar code below, then set the delay (from 0-30,000 milliseconds) by scanning digits from the inside back cover, then scanning Save.

User-Specified Good Read Delay

## Trigger Modes

#### Manual/Serial Trigger

You can activate the imager either by pressing the trigger, or using a serial trigger command (see Trigger Commands on page 12-4). When in manual trigger mode, the imager scans until a bar code is read, or until the trigger is released.

When in serial mode, the imager scans until a bar code has been read or until the deactivate command is sent. In serial mode, the imager can also be set to turn itself off after a specified time has elapsed (see Read Time-Out, which follows).

Manual/Serial Trigger

#### Read Time-Out

Use this selection to set a time-out (in milliseconds) of the imager's trigger when using serial commands to trigger the imager, or if the imager is in manual trigger mode. Once the imager has timed out, you can activate the imager either by pressing the trigger or using a serial trigger command. After scanning the **Read** *Time-Out* bar code, set the time-out duration (from 0-300,000 milliseconds) by scanning digits from the inside back cover, then scanning **Save**. Default = 300,000.

Read Time-Out

#### Manual Trigger, Low Power

The imager powers down until the trigger is pulled. When the trigger is pulled, the imager powers up and operates until there is no triggering for the time set with the Low Power Time-Out bar code below. There is a delay of up to one second in operation when the imager is first triggered, but there is no delay when operating in low power time-out mode.

Manual Trigger, Low Power

Note: **Manual Trigger, Low Power** cannot be used with keyboard wedge applications.

#### Low Power Time-Out Timer

Scan the Low Power Time-Out bar code to change the time-out duration (in seconds). Then scan the time-out duration (from 0-300 seconds) from the inside back cover, and **Save**. Default = 120 seconds.

If the unit remains idle during the low power time-out interval, the unit goes into low power mode. Whenever the trigger is enabled, the low power time-out timer is reset.

Low Power Time-Out

Note: This time-out does not begin until the imager time-out setting has expired.

#### Scan Stand Mode

When a unit is in Scan Stand mode, it remains idle as long as it sees the Scan Stand symbol. (See Scan Stand Symbol on page 3-6.) When a different code is presented, the imager is triggered to read the new code.

Note: The imager automatically adjusts the illumination LEDs to the lowest light level possible to maintain a good lock on the Scan Stand symbol. When a symbol is presented, the imager's light levels adjust to the saved setting (see LED Power Level on page 3-9). This mode requires at least 50 lux of ambient light to operate correctly.

#### Scan Stand Symbol

Note: Scan Stand mode does not work when scanner is programmed for the laser emulation interface.

When a unit is in Scan Stand mode, the LEDs shine at the Scan Stand symbol on the base of the stand which tells it to remain idle. When the Scan Stand symbol is covered, the imager turns the LEDs on at the configured power level (Default High) and attempts to find and decode bar codes in its field of view.

#### Presentation Mode

Note: Presentation mode does not work when an imager is programmed for the

laser emulation interface.

Note: This mode requires at least 50 lux of ambient light to operate correctly.

This programs the imager to work in Presentation Mode.

Presentation Mode

#### Presentation LED Behavior after Decode

When an imager is in presentation mode, the LEDs remain on and continue scanning for a short time after a bar code is decoded. If you wish to turn the LEDs off immediately after a bar code is decoded, scan the **LEDs Off** bar code, below. *Default = LEDs On*.

\* LEDs On

#### Presentation Sensitivity

Presentation Sensitivity is a numeric range that increases or decreases the imager's reaction time to bar code presentation. To set the sensitivity, scan the **Sensitivity** bar code, then scan the degree of sensitivity (from 0-20) from the inside back cover, and **Save**. 0 is the most sensitive setting, and 20 is the least sensitive. Default = 1.

Sensitivity

#### Hands Free Time-Out

The Scan Stand and Presentation Modes are referred to as "hands free" modes. If the imager's trigger is pulled when using a hands free mode, the imager changes to manual trigger mode. You can set the time the imager should remain in manual trigger mode by setting the Hands Free Time-Out. Once the time-out value is reached, (if there have been no further trigger pulls) the imager reverts to the original hands free mode.

Scan the *Hands Free Time-Out* bar code, then scan the time-out duration (from 0-300,000 milliseconds) from the inside back cover, and *Save*. Default = 5,000 ms.

Hands Free Time-Out

## Reread Delay

This sets the time period before the imager can read the *same* bar code a second time. Setting a reread delay protects against accidental rereads of the same bar code. Longer delays are effective in minimizing accidental rereads. Use shorter delays in applications where repetitive bar code scanning is required. *Default = Medium.* 

Reread Delay only works when in Presentation Mode (see page 3-6)).

Short (500 ms)

Long (1000 ms)

## **User-Specified Reread Delay**

If you want to set your own length for the reread delay, scan the bar code below, then set the delay (from 0-30,000 milliseconds) by scanning digits from the inside back cover, then scanning *Save*.

**User-Specified Reread Delay** 

#### LED Power Level

This selection allows you to adjust LED and aimer brightness. *Off* is used when no illumination is needed. **Low** is used if low illumination is sufficient. **High** (the default) is the brightest setting.

If you have an aimer delay programmed (see Aimer Delay on page 3-10), the aimer will be at 100% power during the delay, regardless of the LED Power Level.

Note: If you scan the **Off** bar code, both the aimer and illumination lights turn off, making it impossible to scan bar codes in low light. To turn the LED Power Level back on, move to a brightly lit area and scan either the **Low** or the **High** bar code below.

## Illumination Lights

If you want the illumination lights on while reading a bar code, scan the **Lights** On bar code, below. However, if you want to turn just the lights off, scan the Lights Off bar code.

Note: This setting does not affect the aimer light. The aiming light can be set using Aimer Mode (page 3-11).

Lights On

#### Imager Time-Out

Imager Time-Out powers down the imager after the unit has been idle for the specified time. To prevent the imager from powering down, set this time-out to 0. Scan the bar code below, then set the time-out by scanning digits (from 0 - 999,999 ms) from the inside back cover, then scanning **Save.** Default = 60,000 ms.

Note: The default applies to Firmware 31205122-064 or greater. Refer to the Show Software Revision on page 11-2 for information on determining the firmware revision in your unit.

Imager Time-Out

## Aimer Delay

The aimer delay allows a delay time for the operator to aim the imager before the picture is taken. Use these codes to set the time between when the trigger is pulled and when the picture is taken. During the delay time, the aiming light will appear, but the laser/LEDs won't turn on until the delay time is over.

200 milliseconds

400 milliseconds

\* Off (no delay)

## **User-Specified Aimer Delay**

If you want to set your own length for the duration of the delay, scan the bar code below, then set the time-out by scanning digits (0 - 4,000 ms) from the Programming Chart inside the back cover of this manual, then scan **Save**.

**Delay Duration** 

#### Aimer Mode

Note: Concurrent is the default for units with IT4X00 engines. Interlaced is the default for units with IT5X00 engines. Refer to the Show Engine Revision on page 11-1 for information on determining the engine in your unit.

The Aimer Mode feature allows you to lower peak current during scanning by alternating the aimer and illumination laser/LEDs. When the Interlaced bar code is scanned, the aimer and illumination laser/LEDs are not allowed to be on at the same time. Interlaced, the recommended setting for the IT5X00 engines, limits the peak current draw during scanning. For IT4X00 engines, the Interlaced setting reduces the frame capture rate. When the Concurrent bar code is scanned, the aimer and illumination laser/LEDs are allowed to light at the same time. This is the recommended setting for the IT4X00 engines. Select Off for fixed mount applications when the aimer is not needed.

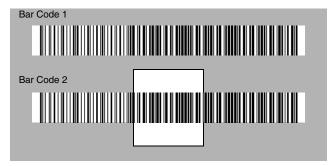

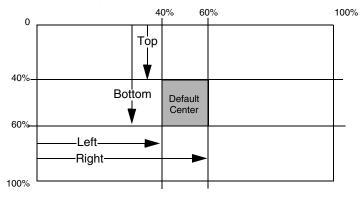

## **Centering**

Use Centering to narrow the imager's field of view to make sure the imager reads only those bar codes intended by the user. For instance, if multiple codes are placed closely together, centering will insure that only the desired codes are read. (Centering can be used in conjunction with Aimer Delay, page 3-10, for the most error-free operation in applications where multiple codes are spaced closely together. Using the Aimer Delay and Centering features, the imager can emulate the operation of older systems, such as linear laser bar code imagers.) In the example below, the gray area is the full imager field of view and the white area is the centering window. Bar Code 1 will not be read, while Bar Code 2 will be.

The default centering window is a 128x96 pixel area in the center of the imager's field of view. The following diagram illustrates the default top, bottom, left, and right pixel positions, measured from the top and the left side of the imager's field of view, which is 640 by 480 pixels.

If a bar code is not within the predefined window, it will not be decoded or output by the imager. If centering is turned on by scanning *Centering On*, the imager only reads codes that intersect the centering window you specify using the *Top*, *Bottom*, *Left*, or *Right* bar codes.

Scan *Centering On*, then scan one of the following bar codes to change the top, bottom, left, or right of the centering window. Then scan the percent you want to shift the centering window using digits on the inside back cover of this manual. Scan *Save*. Default Centering = 40% for Top and Left, 60% for Bottom and Right.

Centering On

Left of Centering Window

\* Centering Off

Right of Centering Window

#### Decode Search Mode

There are three selectable decode (scanning) modes:

**Full Omnidirectional** - Searches for bar code features beginning at the center of an image, and searches to the image's limits. This mode reads all symbologies (including OCR), in any orientation. The Full Omnidirectional search is very thorough which may slow performance time.

Note: This search mode is the default setting for the IT4800 and IT4600/48002D imagers.

**Quick Omnidirectional** - This is an abbreviated search for bar code features around the center region of an image. This mode quickly reads all symbologies in any orientation. The Quick Omnidirectional mode may miss some off-center symbols, as well as larger Data Matrix and QR Code symbols.

Quick Omnidirectional

**Advanced Linear Decoding** - Performs quick horizontal linear scans in a center band of the image. This mode is *not* omnidirectional, but does quickly read linear and stacked bar codes. Advanced Linear Decoding cannot read 2D, OCR, or Postal symbols.

Note: This search mode is the default setting for the IT4600/4800 point-andshoot PDF imagers.

## Output Sequence Overview

#### Require Output Sequence

When turned off, the bar code data will be output to the host as the Imager decodes it. When turned on, all output data must conform to an edited sequence or the imager will not transmit the output data to the host device.

Note: This selection is unavailable when the Multiple Symbols Selection is turned on.

#### **Output Sequence Editor**

This programming selection allows you to program the imager to output data (when scanning more than one symbol) in whatever order your application requires, regardless of the order in which the bar codes are scanned. Reading the *Default Sequence* symbol programs the imager to the Universal values, shown below. These are the defaults. Be **certain** you want to delete or clear all formats before you read the *Default Sequence* symbol.

Note: To make Output Sequence Editor selections, you'll need to know the code I.D., code length, and character match(es) your application requires. Use the Alphanumeric symbols (inside back cover) to read these options.

#### To Add an Output Sequence

1. Scan the *Enter Sequence* symbol (see Multiple Symbols, page 3-18).

#### 2. Code I.D.

On the Symbology Chart on page A-1, find the symbology to which you want to apply the output sequence format. Locate the Hex value for that symbology and scan the 2 digit hex value from the Programming Chart (inside back cover).

#### Length

Specify what length (up to 9999 characters) of data output will be acceptable for this symbology. Scan the four digit data length from the Programming Chart. (Note: 50 characters is entered as 0050. 9999 is a universal number, indicating all lengths.) When calculating the length, you must count any programmed prefixes, suffixes, or formatted characters as part of the length (unless using 9999).

#### 4. Character Match Sequences

On the ASCII Conversion Chart (Code Page 1252), page A-4, find the Hex value that represents the character(s) you want to match. Use the Programming Chart to read the alphanumeric combination that represents the ASCII characters. (99 is the Universal number, indicating all characters.)

#### 5. End Output Sequence Editor

Scan **F** F to enter an Output Sequence for an additional symbology, or **Save** to save your entries.

#### Other Programming Selections

#### Discard

This exits without saving any Output Sequence changes.

## **Output Sequence Examples**

In this example, you are scanning Code 93, Code 128, and Code 39 bar codes, but you want the imager to output Code 39 1st, Code 128 2nd, and Code 93 3rd, as shown below.

Note: Code 93 must be enabled to use this example.

A - Code 39

C - Code 93

You would set up the sequence editor with the following command line:

#### SEQBLK62999941FF6A9999942FF69999943FF

The breakdown of the command line is shown below:

| SEQBLK | sequence editor start command                                |
|--------|--|
| 62     | code identifier for Code 39                                  |
| 9999   | code length that must match for Code 39, 9999 = all lengths  |
| 41     | start character match for Code 39, 41h = "A"                 |
| FF     | termination string for first code                            |
| 6A     | code identifier for Code 128                                 |
| 9999   | code length that must match for Code 128, 9999 = all lengths |
| 42     | start character match for Code 128, 42h = "B"                |
| FF     | termination string for second code                           |
| 69     | code identifier for Code 93                                  |
| 9999   | code length that must match for Code 93, 9999 = all lengths  |
| 43     | start character match for Code 93, 43h = "C"                 |
| FF     | termination string for third code                            |
|        |  |

To program the previous example using specific lengths, you would have to count any programmed prefixes, suffixes, or formatted characters as part of the length. If you use the example on page 3-16, but assume a <CR> suffix and specific code lengths, you would use the following command line:

050011

#### SEQBLK62001241FF6A001342FF69001243FF

The breakdown of the command line is shown below:

SEQBLK sequence editor start command 62 code identifier for Code 39 0012 A - Code 39 sample length (11) plus CR suffix (1) = 12 41 start character match for Code 39, 41h = "A" FF termination string for first code 6A code identifier for Code 128 0013 B - Code 128 sample length (12) plus CR suffix (1) = 13 42 start character match for Code 128, 42h = "B" FF termination string for second code 69 code identifier for Code 93 C - Code 93 sample length (11) plus CR suffix (1) = 12 0012 start character match for Code 93, 43h = "C" 43 FF termination string for third code

#### Output Sequence Editor

Enter Sequence

**Default Sequence** 

## Require Output Sequence

When an output sequence is **Required**, all output data must conform to an edited sequence or the imager will not transmit the output data to the host device. When it's **On/Not Required**, the imager will attempt to get the output data to conform to an edited sequence, but if it cannot, the imager transmits all output data to the host device as is.

When the output sequence is **Off**, the bar code data is output to the host as the imager decodes it.

Note: This selection is unavailable when the Multiple Symbols Selection is turned on.

Required

On/Not Required

## Multiple Symbols

Note: This feature does not work when the Imager is in Low Power mode.

When this programming selection is turned *On*, it allows you to read multiple symbols with a single pull of the Imager's trigger. If you press and hold the trigger, aiming the Imager at a series of symbols, it reads unique symbols once, beeping (if turned on) for each read. The imager attempts to find and decode new symbols as long as the trigger is pulled. When this programming selection is turned *Off*, the Imager will only read the symbol closest to the aiming beam.

On

#### No Read

With No Read turned *On*, the Imager notifies you if a code cannot be read. If using a Quick\*View Scan Data Window, an "NR" appears when a code cannot be read. If No Read is turned *Off*, the "NR" will not appear.

On

IT4600/4800 User's Guide

If you want a different notation than "NR," for example, "Error," or "Bad Code," you can edit the output message using the Data Formatter (page 5-5). The hex code for the No Read symbol is 9C.

## Print Weight

Print Weight is used to adjust the way the imager reads Matrix symbols. If an imager will be seeing consistently heavily printed matrix symbols, then a print weight of 6 may improve the reading performance. For consistently light printing, a print weight of 2 may help. After scanning the **Set Print Weight** bar code, set the print weight (from 1-7) by scanning digits from the inside back cover, then scanning **Save**. Default = 4.

Set Print Weight

#### Video Reverse

Video Reverse is used to allow the imager to read bar codes that are inverted. The "Off" bar code below is an example of this type of bar code. If additional menuing is required, Video Reverse must be disabled to read the menu bar codes and then re-enabled after menuing is completed.

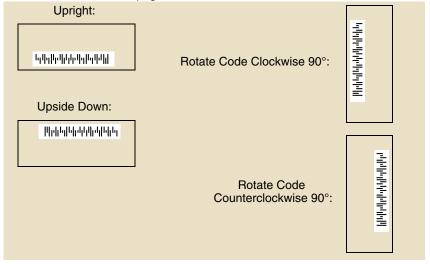

Note: Images downloaded from the unit will not be reversed. This is a setting for decoding only.

\* Off

## Working Orientation

Some bar codes are direction-sensitive. For example, KIX codes and OCR can misread when scanned sideways or upside down. Use the working orientation settings if your direction-sensitive codes will not usually be presented upright to the scanner. *Default = Upright*.

Upside Down

Rotate Code Clockwise 90° (Rotate Imager Counterclockwise)

Rotate Imager Counterclockwise 90° (Rotate Imager Clockwise)

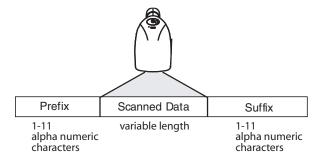

# 4

## **Data Editing**

## Prefix/Suffix Overview

When a bar code is scanned, additional information is sent to the host computer along with the bar code data. This group of bar code data and additional, user-defined data is called a "message string." The selections in this section are used to build the user-defined data into the message string.

Prefix and Suffix characters are data characters that can be sent before and after scanned data. You can specify if they should be sent with all symbologies, or only with specific symbologies. The following illustration shows the breakdown of a message string:

## Points to Keep In Mind

- It is not necessary to build a message string. The selections in this chapter are only used if you wish to alter the default settings. Default prefix = None.
   Default suffix = None.
- A prefix or suffix may be added or cleared from one symbology or all symbologies.
- You can add any prefix or suffix from the ASCII Conversion Chart (Code Page 1252) on page A-4, plus Code I.D. and AIM I.D.
- You can string together several entries for several symbologies at one time.
- Enter prefixes and suffixes in the order in which you want them to appear on the output.
- When setting up for specific symbologies, instead of All Symbologies, the symbology ID value counts as an added prefix or suffix character.

#### To Add a Prefix or Suffix:

- Step 1. Scan the Add Prefix or Add Suffix symbol (page 4-4).
- Step 2. Determine the 2 digit Hex value from the Symbology Chart (included in Appendix A) for the symbology to which you want to apply the prefix or suffix. For example, for Code 128, Code ID is "j" and Hex ID is "6A".
- **Step 3.** Scan the 2 hex digits from the Programming Chart inside the back cover of this manual or scan **9**, **9** for all symbologies.
- **Step 4.** Determine the hex value from the ASCII Conversion Chart (Code Page 1252) on page A-4, for the prefix or suffix you wish to enter.
- **Step 5.** Scan the 2 digit hex value from the Programming Chart inside the back cover of this manual.
- **Step 6.** Repeat Steps 4 and 5 for every prefix or suffix character.
- Step 7. To add the Code I.D., scan 5, C, 8, 0. To add AIM I.D., scan 5, C, 8, 1. To add a backslash (\), scan 5, C, 5, C.
- Note: To add a backslash (\) as in Step 7, you must scan 5C twice once to create the leading backslash and then to create the backslash itself.
- Step 8. Scan Save to exit and save, or scan Discard to exit without saving.

Repeat Steps 1-6 to add a prefix or suffix for another symbology.

#### Example: Add a Suffix to a specific symbology

To send a CR (carriage return) Suffix for UPC only:

- Step 1. Scan Add Suffix.
- **Step 2.** Determine the 2 digit hex value from the Symbology Chart (included in Appendix A) for UPC.
- **Step 3.** Scan **6**, **3** from the Programming Chart inside the back cover of this manual.
- **Step 4.** Determine the hex value from the ASCII Conversion Chart (Code Page 1252) on page A-4, for the CR (carriage return).
- **Step 5.** Scan **0**, **D** from the Programming Chart inside the back cover of this manual.
- Step 6. Scan Save, or scan Discard to exit without saving.

#### To Clear One or All Prefixes or Suffixes:

You can clear a single prefix or suffix, or clear all prefixes/suffixes for a symbology. When you Clear One Prefix (Suffix), the specific character you select is deleted from the symbology you want. When you Clear All Prefixes (Suffixes), all the prefixes or suffixes for a symbology are deleted.

- Step 1. Scan the Clear One Prefix or Clear One Suffix symbol.
- Step 2. Determine the 2 digit Hex value from the Symbology Chart (included in Appendix A) for the symbology from which you want to clear the prefix or suffix.
- **Step 3.** Scan the 2 digit hex value from the Programming Chart inside the back cover of this manual or scan **9**, **9** for all symbologies.

Your change is automatically saved.

#### To Add a Carriage Return Suffix to all Symbologies

Scan the following bar code if you wish to add a carriage return suffix to all symbologies at once. This action first clears all current suffixes, then programs a carriage return suffix for all symbologies.

Add CR Suffix All Symbologies

## **Prefix Selections**

Add Prefix

Clear All Prefixes

## Suffix Selections

Clear All Suffixes

#### Function Code Transmit

When this selection is enabled and function codes are contained within the scanned data, the imager transmits the function code to the terminal. Charts of these function codes are provided in Supported Interface Keys starting on page 10-3. When the imager is in keyboard wedge mode, the scan code is converted to a key code before it is transmitted. Default = Enable.

IT4600/4800 User's Guide

# Intercharacter, Interfunction, and Intermessage Delays

Some terminals drop information (characters) if data comes through too quickly. Intercharacter, interfunction, and intermessage delays slow the transmission of data, increasing data integrity.

Each delay is composed of a 5 millisecond step. You can program up to 99 steps (of 5 ms each) for a range of 0-495 ms.

## Intercharacter Delay

An intercharacter delay of up to 495 milliseconds may be placed between the transmission of each character of scanned data. Scan the **Intercharacter Delay** bar code below, then scan the number of milliseconds and the **SAVE** bar code using the **Programming Chart** inside the back cover of this manual.

Intercharacter Delay

To remove this delay, scan the **Intercharacter Delay** bar code, then set the number of steps to 0. Scan the **SAVE** bar code using the Programming Chart inside the back cover of this manual.

Note: Intercharacter delays are not supported in USB serial emulation.

# User Specified Intercharacter Delay

An intercharacter delay of up to 495 milliseconds may be placed after the transmission of a particular character of scanned data. Scan the **Delay Length** bar code below, then scan the number of milliseconds and the **SAVE** bar code using the **Programming Chart** inside the back cover of this manual.

Next, scan the **Character to Trigger Delay** bar code, then the 2-digit hex value for the ASCII character that will trigger the delay ASCII Conversion Chart (Code Page 1252) on page A-4.

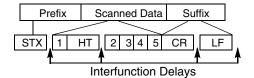

To remove this delay, scan the **Delay Length** bar code, and set the number of steps to 0. Scan the **SAVE** bar code using the Programming Chart inside the back cover of this manual.

## Interfunction Delay

An interfunction delay of up to 495 milliseconds may be placed between the transmission of each segment of the message string. Scan the **Interfunction Delay** bar code below, then scan the number of milliseconds and the **SAVE** bar code using the Programming Chart inside the back cover of this manual.

Interfunction Delay

To remove this delay, scan the **Interfunction Delay** bar code, then set the number of steps to 0. Scan the **SAVE** bar code using the Programming Chart inside the back cover of this manual.

# Intermessage Delay

An intermessage delay of up to 495 milliseconds may be placed between each scan transmission. Scan the **Intermessage Delay** bar code below, then scan the number of milliseconds and the **SAVE** bar code using the Programming Chart inside the back cover of this manual.

1st Scan Transmission 2nd Scan Transmission Intermessage Delay

Intermessage Delay

To remove this delay, scan the **Intermessage Delay** bar code, then set the number of steps to 0. Scan the **SAVE** bar code using the Programming Chart inside the back cover of this manual.

# 5 D

# **Data Formatting**

## Data Format Editor Introduction

You may use the Data Format Editor to change the imager's output. For example, you can use the Data Format Editor to insert characters at certain points in bar code data as it is scanned. The selections in the following pages are used only if you wish to alter the output. *Default Data Format setting = None.* 

Normally, when you scan a bar code, it gets outputted automatically; however when you do a format, you must use a "send" command (see Send Commands on page 5-2) within the format program to output data.

Multiple formats may be programmed into the imager. They are stacked in the order in which they are entered. However, the following list presents the order in which formats are applied:

- 1. Specific Term ID, Actual Code ID, Actual Length
- 2. Specific Term ID, Actual Code ID, Universal Length
- 3. Specific Term ID, Universal Code ID, Actual Length
- 4. Specific Term ID, Universal Code ID, Universal Length
- 5. Universal Term ID, Actual Code ID, Actual Length
- 6. Universal Term ID, Actual Code ID, Universal Length
- 7. Universal Term ID, Universal Code ID, Actual Length
- 8. Universal Term ID, Universal Code ID, Universal Length

If you have changed data format settings, and wish to clear all formats and return to the factory defaults, scan the **Default Data Format** code on page 5-5.

## To Add a Data Format

Step 1. Scan the Enter Data Format symbol (page 5-5).

#### Step 2. Primary/Alternate Format

Determine if this will be your primary data format, or one of 3 alternate formats. (Alternate formats allow you "single shot" capability to scan one bar code using a different data format. After the one bar code has been read, the imager reverts to the primary data format. See page 5-6.) If you are programming the primary format, scan 0 using the Programming Chart inside the back cover of this manual. If you are programming an alternate format, scan 1, 2, or 3, depending on the alternate format you are programming.

## Step 3. Terminal Type

Refer to Supported Terminals (page 2-2) and locate the Terminal ID number for your PC. Scan three numeric bar codes on the inside back cover to program the imager for your terminal ID (you must enter 3 digits). For example, scan **0 0 3** for an AT wedge.

Note: The wildcard for all terminal types is 099.

## Step 4. Code I.D.

In Appendix A, find the symbology to which you want to apply the data format. Locate the Hex value for that symbology and scan the 2 digit hex value from the Programming Chart inside the back cover of this manual.

## Step 5. Length

Specify what length (up to 9999 characters) of data will be acceptable for this symbology. Scan the four digit data length from the Programming Chart inside the back cover of this manual. (Note: 50 characters is entered as 0050. 9999 is a universal number, indicating all lengths.)

## Step 6. Editor Commands

Refer to Data Format Editor Commands (page 5-2). Scan the symbols that represent the command you want to enter. 94 alphanumeric characters may be entered for each symbology data format.

**Step 7.** Scan **Save** from the Programming Chart inside the back cover of this manual to save your entries.

# **Other Programming Selections**

## Clear One Data Format

This deletes one data format for one symbology. If you are clearing the primary format, scan **0** from the Programming Chart inside the back cover of this manual. If you are clearing an alternate format, scan **1**, **2**, or **3**, depending on the alternate format you are clearing. Scan the Terminal Type and Code I.D. (see Supported Terminals on page 2-2), and the bar code data length for the specific data format that you want to delete. All other formats remain unaffected.

- Save from the Programming Chart inside the back cover of this manual This exits, saving any Data Format changes.
- Discard from the Programming Chart inside the back cover of this manual This exits without saving any Data Format changes.

## Data Format Editor Commands

#### Send Commands

- F1 Send all characters followed by "xx" key or function code, starting from current cursor position. **Syntax = F1xx** (xx stands for the hex value for an ASCII code, see ASCII Conversion Chart (Code Page 1252) on page A-4.)
- F2 Send "nn" characters followed by "xx" key or function code, starting from current cursor position. *Syntax = F2nnxx* (nn stands for the numeric value (00-99) for the number of characters and xx stands for the hex value for an ASCII code. See ASCII Conversion Chart (Code Page 1252) on page A-4.)
- F3 Send up to but not including "ss" character (Search and Send) starting from current cursor position, leaving cursor pointing to "ss" character followed by "xx" key or function code. **Syntax = F3ssxx** (ss and xx both stand for the hex values for ASCII codes, see ASCII Conversion Chart (Code Page 1252) on page A-4.)

- F4 Send "xx" character "nn" times (Insert) leaving cursor in current cursor position. *Syntax = F4xxnn* (xx stands for the hex value for an ASCII code, see ASCII Conversion Chart (Code Page 1252) on page A-4, and nn is the numeric value (00-99) for the number of times it should be sent.)
- E9 Send all but the last "nn" characters, starting from the current cursor position. *Syntax = E9nn* (nn is the numeric value (00-99) for the number of characters that will not be sent at the end of the message.)

#### Move Commands

- F5 Move the cursor ahead "nn" characters from current cursor position. *Syntax = F5nn* (nn stands for the numeric value (00-99) for the number of characters the cursor should be moved ahead.)
- F6 Move the cursor back "nn" characters from current cursor position. **Syntax = F6nn** (nn stands for the numeric value (00-99) for the number of characters the cursor should be moved back.)
- F7 Move the cursor to the beginning of the data string. **Syntax = F7**.
- EA Move the cursor to the end of the data string. Syntax = EA

#### Search Commands

- F8 Search ahead for "xx" character from current cursor position, leaving cursor pointing to "xx" character. **Syntax = F8xx** (xx stands for the hex value for an ASCII code, see ASCII Conversion Chart (Code Page 1252) on page A-4.)
- F9 Search back for "xx" character from current cursor position, leaving cursor pointing to "xx" character. **Syntax = F9xx** (xx stands for the hex value for an ASCII code, see ASCII Conversion Chart (Code Page 1252) on page A-4.)
- E6 Search ahead for the first non "xx" character from the current cursor position, leaving cursor pointing to non "xx" character. **Syntax = E6xx** (xx stands for the hex value for an ASCII code, see ASCII Conversion Chart (Code Page 1252) on page A-4.
- E7 Search back for the first non "xx" character from the current cursor position, leaving cursor pointing to non "xx" character. **Syntax = E7xx** (xx stands for the hex value for an ASCII code, see ASCII Conversion Chart (Code Page 1252) on page A-4.)

### Miscellaneous Commands

- FB Suppress all occurrences of up to 15 different characters, starting at the current cursor position, as the cursor is advanced by other commands. When the FC command is encountered, the suppress function is terminated. The cursor is not moved by the FB command. Syntax = FBnnxxyy . .zz where nn is a count of the number of suppressed characters in the list and xxyy .. zz is the list of characters to be suppressed. (xx stands for the hex value for an ASCII code, see ASCII Conversion Chart (Code Page 1252) on page A-4.)
- FC Disables suppress filter and clear all suppressed characters. **Syntax = FC**.
- E4 Replaces up to 15 characters in the data string with user specified characters. Replacement continues until the E5 command is encountered. **Syntax = E4nnxx**<sub>1</sub>**xx**<sub>2</sub>**yy**<sub>1</sub>**yy**<sub>2</sub>...**zz**<sub>1</sub>**zz**<sub>2</sub> where nn is the total count of both

- characters to be replaced plus replacement characters;  $xx_1$  defines characters to be replaced and  $xx_2$  defines replacement characters, continuing through  $zz_1$  and  $zz_2$ .
- E5 Terminates character replacement. **Syntax = E5**.
- FE Compare character in current cursor position to the character "xx." If characters are equal, increment cursor. If characters are not equal, no format match. **Syntax = FExx** (xx stands for the hex value for an ASCII code, see ASCII Conversion Chart (Code Page 1252) on page A-4.)
- EC Check to make sure there is an ASCII number at the current cursor position. If character is not numeric, format is aborted. **Syntax = EC**.
- ED Check to make sure there is a non-numeric ASCII character at the current cursor position. If character is numeric, format is aborted. *Syntax = ED*.

## Data Format Editor

**Enter Data Format** 

Clear One Data Format

Clear All Data Formats

## Data Formatter

When Data Formatter is turned off, the bar code data is output to the host as read (including prefixes and suffixes). Choose one of the following options. *Default* = Data Formatter On, but Not Required.

\* Data Formatter On. but Not Required

When Data Formatter is required, all input data must conform to an edited format or the imager does not transmit the input data to the host device.

Data Format On, Format Required

## Alternate Data Formats

Alternate formats allow you "single shot" capability to scan one bar code using a different data format than your primary format. When data formats are programmed (see page 5-1), you must input whether you are programming the primary format, or an alternate format numbered 1, 2, or 3.

An alternate format is initiated by scanning one of the 3 alternate format bar codes below. The imager will scan the next bar code, formatting the data with the selected alternate format, then revert immediately to the primary format.

Alternate Data Format 1

# **Secondary Interface**

By switching secondary interface cables, the IT4600/4800 imager can, for example, communicate with a portable data terminal (secondary interface) in addition to the host terminal (primary interface). See the table below for the secondary interfaces for each IT4600/4800 model. This table applies to all IT4600/4800 focal distances and decoding options.

| Models                   | Primary   | Secondary                     |
|--------------------------|---|-------------------------------|
| 4600XX03XX<br>4800XX03XX | True RS-232   | True RS-232                   |
| 4600XX05XX<br>4800XX05XX | Keyboard wedge, TTL level<br>232, TTL level 232 serial<br>wedge, IBM 4683, wand emula-<br>tion, USB keyboard, USB HID,<br>USB retail (IBM SurePOS),<br>USB COM port emulation | Wand Emulation, TTL level 232 |

The secondary interface can be programmed at any time.

You can temporarily disable the secondary interface, but still retain the secondary interface settings in the imager's memory by scanning the **Disable** bar code below. To re-enable the secondary interface, scan the Enable bar code. *Default =Disable*.

\* Disable

Enable

# Secondary RS-232 Connection

All communication parameters between the imager and terminal must match for correct data transfer through the serial port using RS-232 protocol.

RS-232 programmable selections are used by both the primary and secondary interfaces. Changing an RS-232 parameter (e.g., baud rate or parity), while in primary *or* secondary mode will affect both interfaces. If you want to change the RS-232 settings, refer to Connecting the Imager with RS-232 Serial Port, page 2-9.

RS-232 Interface

# Secondary Code 39 Wand Emulation

In Wand Emulation mode, the imager decodes the bar code then sends data in the same format as a wand imager. The Code 39 Format converts all symbologies to Code 39. The Same Code Format transmits UPC, EAN, Code 128 and Interleaved 2 of 5 without any changes, but converts all other symbologies to Code 39. These codes set the transmission rate to 25 inches per second and the output polarity to black, high. *Default = Code 39 Format*.

The *Code 39 Format* bar code below sets the terminal ID to 61, and the *Same Code Format* bar code sets the terminal ID to 64.

Wand Emulation
Same Code Format

Wand Emulation Code 39 Format

## Wand/Laser Emulation Multi Block

Note: Changing secondary wand emulation settings also changes the primary wand emulation settings (see Wand Emulation on page 2-14).

## Delay Between Blocks

This sets the delay time between data blocks. Default = 50ms.

# Overall Checksum

When this option is turned on, a computed check character is added at the end of the entire message. The check character is the character which when Exclusive-OR'd with every preceding character of the message yields a result of 0x00 (00H). Default = Off.

## Wand Emulation Transmission Rate

The Transmission Rate is limited by the terminal's ability to receive data without dropping characters. Default = 25 inches/second.

# Wand Emulation Polarity

The Polarity can be sent as standard with black bars high, or reversed with white bars high. Default = Black High.

## Wand Emulation Idle

The idle describes the state of the imager when no data is being transmitted. When in Wand Emulation mode, you must set the imager's idle state to match the idle state for the device to which the imager is connected. *Default = Idle High*.

## Data Block Size

This transmits the data in smaller blocks to prevent buffer overflow. *Default = 40*.

# Secondary Laser Emulation

Use this selection when connecting to a secondary terminal with integral decoding. This also sets the transmission rate to 36 scans per second, the polarity to white high, and deletes all prefixes and suffixes.

\*Laser Emulation Same Code Output

When you scan the Code 39 Output bar code, the scanner decodes and reencodes the data and sends the data to the host as Code 39.

Laser Emulation Code 39 Output

## Laser Emulation Transmission Rate

The Transmission Rate is limited by the terminal's ability to receive data without dropping characters. *Default = 36 scans/second.* 

# Laser Emulation Polarity

The Polarity can be sent as standard with white bars high, or reversed with black bars high. *Default = White High.* 

\* White High

IT4600/4800 User's Guide

## Laser Emulation Idle

The idle describes the state of the imager when no data is being transmitted. You must set the imager's idle state to match the idle state for the device to which the imager is connected. *Default = Idle High*.

Idle Low

\* Idle High

# Secondary Trigger Mode

# Manual/Serial Trigger

You can activate the imager either by pressing the trigger, or using a serial trigger command (see Trigger Commands on page 12-4). When in manual trigger mode, the imager scans until a bar code is read, or until the trigger is released.

When in serial mode, the imager scans until a bar code has been read or until the deactivate command is sent. In serial mode, the imager can also be set to turn itself off after a specified time has elapsed (see Read Time-Out, which follows).

\* Manual/Serial Trigger

### Read Time-Out

Use this selection to set a time-out (in milliseconds) of the imager's trigger when using serial commands to trigger the imager, or if the imager is in manual trigger mode. Once the imager has timed out, you can activate the imager either by pressing the trigger or using a serial trigger command. After scanning the *Read Time-Out* bar code, set the time-out duration (from 0-300,000 milliseconds) by scanning digits from the inside back cover, then scanning *Save*. *Default* = 0 (infinite, or no time-out).

Read Time-Out

Note: Programming Read Time-Out in the secondary interface also programs it in the primary interface.

## Manual Trigger, Low Power

The imager powers down until the trigger is pulled. When the trigger is pulled, the imager powers up and operates until there is no triggering for the time set with the *Low Power Time-Out* bar code below. There is a delay of up to one second in operation when the imager is first triggered, but there is no delay when operating in low power time-out mode.

Manual Trigger, Low Power

Note: **Manual Trigger, Low Power** cannot be used with keyboard wedge applications.

## Low Power Time-Out Timer

Scan the Low Power Time-Out bar code to change the time-out duration (in seconds). Then scan the time-out duration (from 0-300 seconds) from the inside back cover, and **Save**. Default = 120 seconds.

If the unit remains idle during the low power time-out interval, the unit goes into low power mode. Whenever the trigger is enabled, the low power time-out timer is reset.

Low Power Time-Out

Note: This time-out does not begin until the imager time-out setting has expired.

Note: Programming Low Power Time-Out in the secondary interface also

programs it in the primary interface.

## Hands Free Time-Out

The Automatic Trigger and Presentation Modes are referred to as "hands free" modes. If the imager's trigger is pulled when using a hands free mode, the imager changes to manual trigger mode. You can set the time the imager should remain in manual trigger mode by setting the Hands Free Time-Out. Once the time-out value is reached, (if there have been no further trigger pulls) the imager reverts to the original hands free mode.

Note: If you change the time-out duration for the secondary interface, the duration of the primary interface will also be changed.

Scan the Hands Free Time-Out bar code, then scan the time-out duration (from 0-300,000 milliseconds) from the inside back cover, and **Save**. Default = 5,000ms.

Hands Free Time-Out

# Scan Stand Mode

When a unit is in Scan Stand mode, it remains idle as long as it sees the Scan Stand symbol. (See Scan Stand Symbol that follows.) When a different code is presented, the Imager is triggered to read the new code.

Note:The imager automatically adjusts the illumination LEDs to the lowest light level possible to maintain a good lock on the Scan Stand symbol. When a symbol is presented, the imager's light levels adjust to the saved setting (see LED Power Level on page 3-9).

## Scan Stand Symbol

Note: Scan Stand mode does not work when scanner is programmed for the laser emulation interface.

When a unit is in Scan Stand mode, the LEDs shine at the Scan Stand symbol on the base of the stand which tells it to remain idle. When the Scan Stand symbol is covered, the imager turns the LEDs on at the configured power level (Default High) and attempts to find and decode bar codes in its field of view.

## Presentation Mode

This programs the imager to work in Presentation mode. The LEDs are either off or at the lowest power for ambient conditions until a bar code is presented to the imager. Then the LEDs turn on automatically to read the code. Presentation Mode uses ambient light to detect the bar codes. If the light level in the room is not high enough, Presentation Mode may not work properly.

Presentation Mode

# 7

# **Symbologies**

This programming section contains the following menu selections. Refer to Chapter 12 for settings and defaults.

- All Symbologies
- 4-CB (4-State Customer Bar Code)
- Australian Post
- Aztec Code
- British Post
- Canadian Post
- China Post
- Codabar
- Codablock F
- Code 11
- Code 128
- Code 16K
- Code 2 of 5
- Code 39
- Code 49
- Code 93
- Data Matrix
- EAN/JAN-13
- EAN/JAN-8
- EAN•UCC Composite Codes
- IATA Code 2 of 5

- Interleaved 2 of 5
- ID-tag (UPU 4-State)
- Kix (Netherlands) Post
- Korea Post
- Matrix 2 of 5
- MaxiCode
- MicroPDF417
- MSI
- PDF417
- Planet Code
- Plessey Code
- PosiCode A and B
- Postnet
- QR Code
- RSS Expanded
- RSS Limited
- RSS-14
- TCIF Linked Code 39 (TLC39)
- Telepen
- UPC-A
- UPC-A/EAN-13 with Extended Coupon Code

# All Symbologies

If you want to decode all the symbologies allowable for your imager, scan the **All Symbologies On** code. If on the other hand, you want to decode only a particular symbology, scan All Symbologies Off followed by the On symbol for that particular symbology.

# Message Length Description

You are able to set the valid reading length of some of the bar code symbologies. If the data length of the scanned bar code doesn't match the valid reading length, the imager will issue an error beep. You may wish to set the same value for minimum and maximum length to force the imager to read fixed length bar code data. This helps reduce the chances of a misread.

**EXAMPLE:** Decode only those bar codes with a count of 9-20 characters.

Min. length = 09 Max. length = 20

**EXAMPLE:** Decode only those bar codes with a count of 15 characters.

Min. length = 15 Max. length = 15

For a value other than the minimum and maximum message length defaults, scan the bar codes included in the explanation of the symbology, then scan the digit value of the message length and **Save** bar codes on the Programming Chart inside the back cover of this manual. The minimum and maximum lengths and the defaults are included with the respective symbologies.

## Codabar

# <Default All Codabar Settings>

## Codabar

## Codabar Start/Stop Characters

Start/Stop characters identify the leading and trailing ends of the bar code. You may either transmit, or not transmit Start/Stop characters.

Default = Don't Transmit.

Transmit

\* Don't Transmit

## Codabar Check Character

Codabar check characters are created using different "modulos." You can program the imager to read only Codabar bar codes with Modulo 16 check characters. *Default = No Check Character*.

**No Check Character** indicates that the imager reads and transmits bar code data with or without a check character.

When Check Character is set to *Validate and Transmit*, the imager will only read Codabar bar codes printed with a check character, and will transmit this character at the end of the scanned data.

When Check Character is set to *Validate, but Don't Transmit*, the unit will only read Codabar bar codes printed *with* a check character, but will not transmit the check character with the scanned data.

\* No Check Character

Validate Modulo 16, but Don't Transmit

Validate Modulo 16 and Transmit

## Codabar Concatenation

Codabar supports symbol concatenation. When you enable concatenation, the imager looks for a Codabar symbol having a "D" start character, adjacent to a symbol having a "D" stop character. In this case the two messages are concatenated into one with the "D" characters omitted. *Default = On.* 

Stop

Codabar

Character Start

Select Require to prevent the imager from decoding a single "D" Codabar symbol without its companion. This selection has no effect on Codabar symbols without Stop/Start D characters.

## Codabar Message Length

Scan the bar codes below to change the message length. Refer to Message Length Description (page 7-2) for additional information. Minimum and Maximum lengths = 2-60. Minimum Default = 4, Maximum Default = 60.

Minimum Message Length

# Code 39

# < Default All Code 39 Settings >

## Code 39

# Code 39 Start/Stop Characters

Start/Stop characters identify the leading and trailing ends of the bar code. You may either transmit, or not transmit Start/Stop characters. *Default = Don't Transmit*.

I ransmit

\* Don't Transmit

## Code 39 Check Character

**No Check Character** indicates that the imager reads and transmits bar code data with or without a check character.

When Check Character is set to Validate, but Don't Transmit, the unit only reads Code 39 bar codes printed with a check character, but will not transmit the check character with the scanned data.

When Check Character is set to Validate and Transmit, the imager only reads Code 39 bar codes printed with a check character, and will transmit this character at the end of the scanned data. Default = No Check Character.

No Check Character

Validate and Transmit

## Code 39 Message Length

Scan the bar codes below to change the message length. Refer to Message Length Description (page 7-2) for additional information. Minimum and Maximum lengths = 0-48. Minimum Default = 0, Maximum Default = 48.

## Code 39 Append

This function allows the imager to append the data from several Code 39 bar codes together before transmitting them to the host computer. When this function is enabled, the imager stores those Code 39 bar codes that start with a space (excluding the start and stop symbols), and does not immediately transmit the data. The imager stores the data in the order in which the bar codes are read, deleting the first space from each. The imager transmits the appended data when it reads a Code 39 bar code that starts with a character other than a space. Default = Off.

## Code 32 Pharmaceutical (PARAF)

Code 32 Pharmaceutical is a form of the Code 39 symbology used by Italian pharmacies. This symbology is also known as PARAF.

Note: Trioptic Code (page 7-34) must be turned off while scanning Code 32 Pharmaceutical codes.

## Full ASCII

If Full ASCII Code 39 decoding is enabled, certain character pairs within the bar code symbol will be interpreted as a single character. For example: \$V will be decoded as the ASCII character SYN, and /C will be decoded as the ASCII character #. Default = Off.

| NUL %U  | DLE \$P | SP | SPACE | 0 | 0  | @ | %V | Р | Р  | ٤ | %W | р   | +P |
|---------|---------|----|-------|---|----|---|----|---|----|---|----|-----|----|
| SOH \$A | DC1 \$Q | !  | /A    | 1 | 1  | Α | Α  | Q | Q  | а | +A | q   | +Q |
| STX \$B | DC2 \$R | "  | /B    | 2 | 2  | В | В  | R | R  | b | +B | r   | +R |
| ETX \$C | DC3 \$S | #  | /C    | 3 | 3  | С | С  | S | S  | С | +C | s   | +S |
| EOT \$D | DC4 \$T | \$ | /D    | 4 | 4  | D | D  | Т | Т  | d | +D | t   | +T |
| ENQ \$E | NAK \$U | %  | /E    | 5 | 5  | Е | Е  | U | U  | е | +E | u   | +U |
| ACK \$F | SYN \$V | &  | /F    | 6 | 6  | F | F  | ٧ | V  | f | +F | v   | +V |
| BEL \$G | ETB \$W | "  | /G    | 7 | 7  | G | G  | W | W  | g | +G | w   | +W |
| BS \$H  | CAN \$X | (  | /H    | 8 | 8  | Н | Н  | Х | Х  | h | +H | х   | +X |
| HT \$I  | EM \$Y  | )  | /I    | 9 | 9  | I | ı  | Υ | Υ  | i | +l | у   | +Y |
| LF \$J  | SUB \$Z | *  | /J    | : | /Z | J | J  | Z | Z  | j | +J | z   | +Z |
| VT \$K  | ESC %A  | +  | /K    | ; | %F | K | K  | [ | %K | k | +K | {   | %P |
| FF \$L  | FS %B   | ,  | /L    | < | %G | L | L  | ١ | %L | I | +L | I   | %Q |
| CR \$M  | GS %C   | -  | -     | = | %Н | М | М  | ] | %M | m | +M | }   | %R |
| SO \$N  | RS %D   |    |       | > | %l | N | N  | ^ | %N | n | +N | ~   | %S |
| SI \$O  | US %E   | /  | /0    | ? | %J | 0 | 0  | _ | %0 | 0 | +0 | DEL | %T |

Character pairs /M and /N decode as a minus sign and period respectively. Character pairs /P through /Y decode as 0 through 9.

## Code 39 Code Page

Code pages define the mapping of character codes to characters. If the data received does not display with the proper characters, it may be because the bar code being scanned was created using a code page that is different from the one the host program is expecting. If this is the case, scan the bar code below, select the code page with which the bar codes were created (see Code Page Mapping of Printed Bar Codes on page A-6), and scan the value and the **Save** bar code from the Programming Chart on the inside the back cover of this manual. The data characters should then appear properly.

Code 39 Code Page

This selection adds 2 or 5 digits to the end of all scanned UPC-E data. Default = Off for both 2 Digit and 5 Digit Addenda.

2 Digit Addenda On

5 Digit Addenda On

5 Digit Addenda Off

#### UPC-E1

Most U.P.C. bar codes lead with the 0 number system. For these codes, use UPC-E0 (page 7-22). If you need to read codes that lead with the 1 number system, use the UPC-E1 selection. *Default = Off.* 

#### EAN/JAN-13

#### <Default All EAN/JAN Settings>

#### EAN/JAN-13

#### EAN/JAN-13 Check Digit

This selection allows you to specify whether the check digit should be transmitted at the end of the scanned data or not. Default = On.

#### EAN/JAN-13 Addenda

This selection adds 2 or 5 digits to the end of all scanned EAN/JAN-13 data. Default = Off for both 2 Digit and 5 Digit Addenda.

2 Digit Addenda On

#### EAN/JAN-13 Addenda Required

When Addenda Required is set to on, the imager will only read EAN/JAN-13 bar codes that have addenda. Default = Not Required.

Required

#### EAN/JAN-13 Addenda Separator

When this feature is on, there is a space between the data from the bar code and the data from the addenda. When turned off, there is no space. Default = On.

Note: If you want to enable or disable EAN13 with Extended Coupon Code, refer to UPC-A/EAN-13 with Extended Coupon Code (page 7-22).

#### ISBN Translate

This selection causes EAN-13 Bookland symbols to be translated into their equivalent ISBN number format. *Default = Off.* 

#### EAN/JAN-8

<Default All EAN/JAN-8 Settings>

#### EAN/JAN-8

#### EAN/JAN-8 Check Digit

This selection allows you to specify whether the check digit should be transmitted at the end of the scanned data or not. *Default = On.* 

Off

#### EAN/JAN-8 Addenda

This selection adds 2 or 5 digits to the end of all scanned EAN/JAN-8 data. Default = Off for both 2 Digit and 5 Digit Addenda.

2 Digit Addenda On

\* 2 Digit Addenda Off

### EAN/JAN-8 Addenda Required

When Addenda Required is set to on, the imager will only read EAN/JAN-8 bar codes that have addenda. *Default = Not Required*.

Required

Not Required

#### EAN/JAN-8 Addenda Separator

When this feature is on, there is a space between the data from the bar code and the data from the addenda. When turned off, there is no space. Default = On.

7 - 28

#### **MSI**

#### <Default All MSI Settings>

#### **MSI**

#### MSI Check Character

Different types of check characters are used with MSI bar codes. You can program the imager to read MSI bar codes with Type 10 check characters. Default = Validate Type 10, but Don't Transmit.

When Check Character is set to *Validate and Transmit*, the imager will only read MSI bar codes printed with the specified type check character, and will transmit this character at the end of the scanned data.

When Check Character is set to *Validate, but Don't Transmit*, the unit will only read MSI bar codes printed with the specified type check character, but will not transmit the check character with the scanned data.

 Validate Type 10, but Don't Transmit

Validate Type 10 and Transmit

#### MSI Message Length

Scan the bar codes below to change the message length. Refer to Message Length Description (page 7-2) for additional information. Minimum and Maximum lengths = 4-48. Minimum Default = 4, Maximum Default = 48.

Minimum Message Length

Maximum Message Length

#### EAN•UCC Composite Codes

Linear codes are combined with a unique 2D composite component to form a new class called EAN•UCC Composite symbology. EAN•UCC Composite symbologies allow for the co-existence of symbologies already in use.

7 - 38

#### UPC/EAN Version

Scan the *UPC/EAN Version On* bar code to decode EAN•UCC Composite symbols that have a UPC or EAN linear component. (This does not affect EAN•UCC Composite symbols with a UCC/EAN-128 or RSS linear component. If either of these codes are the linear component, either Code 128 or the correct RSS code must be enabled.)

#### EAN•UCC Composite Code Message Length

Scan the bar codes below to change the message length. Refer to Message Length Description (page 7-2) for additional information. Minimum and Maximum lengths = 1-2435. Minimum Default = 1, Maximum Default = 2435.

Minimum Message Length

Maximum Message Length

#### EAN-UCC Emulation

The imager can automatically format the output from any EAN•UCC data carrier to emulate what would be encoded in an equivalent UCC/EAN-128 or RSS and Composite symbol. EAN•UCC data carriers include UPC-A and UPC-E, EAN-13 and EAN-8, ITF-14, UCC/EAN-128, and EAN•UCC RSS and Composites. Data from 2D symbols such as Aztec Code, Data Matrix, or QR Code, which encode a leading FNC1, also invoke EAN•UCC emulation. If UCC/EAN-128 Emulation is selected, the AIM Symbology Identifier is reported as "JC1". If RSS Emulation is selected, the AIM Symbology Identifier is reported as "Je0." Any application that accepts EAN•UCC data can be simplified since it only needs to recognize one data carrier type. Default = No Emulation.

#### TCIF Linked Code 39 (TLC39)

This code is a composite code since it has a Code 39 linear component and a MicroPDF417 stacked code component. All bar code readers are capable of reading the Code 39 linear component. The MicroPDF417 component can only be decoded if TLC39 On is selected. The linear component may be decoded as Code 39 even if TLC39 is off.

#### Postal Codes

Note: For best performance when reading a postal symbology, all other postal symbologies should be turned off. The following postal codes can only be read by a 2D Imager.

#### 4-CB (4-State Customer Bar Code)

Note: You may enable the 4-CB (4-State Customer Bar Code) if you have Firmware 31205122-064 or greater. Refer to the Show Software Revision on page 11-2 for information on determining the firmware revision in your unit.

#### ID-tag (UPU 4-State)

Note: You may enable the ID-tag (UPU 4-State) if you have Firmware 31205122-064 or greater. Refer to the Show Software Revision on page 11-2 for information on determining the firmware revision in your unit.

#### Postnet

#### Postnet Check Digit

This selection allows you to specify whether the check digit should be transmitted at the end of the scanned data.

Transmit Check Digit

#### Planet Code

#### Planet Code Check Digit

This selection allows you to specify whether the check digit should be transmitted at the end of the scanned data.

Transmit Check Digit

#### **British Post**

#### Canadian Post

#### Kix (Netherlands) Post

Note: Kix code can misread when scanned sideways or upside down. Use Working Orientation, page 3-20, if your Kix codes will not usually be presented upright to the scanner.

#### Australian Post

#### Australian Post Interpretation

This option controls what interpretation is applied to customer fields in Australian 4-State symbols. Bar Output lists the bar patterns in "0123" format. Numeric N Table causes that field to be interpreted as numeric data using the N Table. Alphanumeric C Table causes the field to be interpreted as alphanumeric data using the C Table. Refer to the Australian Post Specification Tables.

Note: You may enable the Australian Post Interpretation option if you have Firmware 31205122-064 or greater. Refer to the Show Software Revision on page 11-2 for information on determining the firmware revision in your unit.

Maximum Message Length

#### Aztec Runes

Select *Enable Runes* if you are scanning Aztec runes, which are the smallest type of Aztec Code symbol with the ability to encode a very short license plate message.

**Enable Runes** 

# 8

## **Imaging Commands**

The imager can be used as a digital camera for capturing, manipulating, and transferring images.

Imaging Commands with their modifiers send imaging commands to the imager on a single-use basis, and take effect for the next subsequent image capture. Once that capture is complete, the imager reverts to its imaging default settings. If you wish to change a default setting, you must use the serial default command (see Imaging Default Commands on page 12-22). When the serial default command is used, that selection becomes the new default setting for the imager.

#### Image Snap - IMGSNP

An image is taken whenever the trigger of the IT4600/4800 is pressed, or when the Image Snap (IMGSNP) command is processed. Image Snap is the command processor for image capture, or taking a picture.

The image snap command has many different modifiers that can be used to change the look of the image in memory. Modifiers always begin with numbers and end with a letter (case insensitive). Any number of modifiers may be appended to the IMGSNP command. For example, you can use the following command to snap an image, increase the gain, and have the beeper sound once the snap is complete:

#### IMGSNP2G1B

#### **IMGSNP** Modifiers

- P Imaging Style: Sets the Image Snap style.
  - OP **Decoding Style**. This is similar to the current format for decoding, however, this processing allows a few frames to be taken until the exposure parameters are met. Then the last frame is available for further use.
  - 1P **Photo Style** *(default)*. This attempts to mimic a simple digital camera, and results in a visually optimized image.
  - 2P **Manual Style**. This is an advanced style, and should not normally be used. It allows you the most freedom to set up the imager, and has no auto-exposure.
- **B Beeper:** Causes a beep to sound after an image is snapped.
  - 0B No beep (default)
  - 1B Sounds a beep when the image is captured, notifying the user that the imager can be moved.
- **E Exposure:** This allows you to set the exposure time. Units are 127 microseconds. Exposure is used in Manual Style only. (*Default = 7874*)
  - *n*E Range: 1 7874

- **G Gain:** This modifier boosts the signal and multiplies the pixel value.
  - 1G No gain (default)
  - 2G Medium gain
  - 4G Heavy gain
  - 8G Maximum gain
- **D Delta for Acceptance:** This sets the allowable range for the white value setting (see W Target White Value). Delta is only available when using Photo Style. (*Default = 25*)
  - *n*D Range: 0 255
- **L LED State:** Determines if the LEDs should be on or off, and when. Ambient illumination (0L) is preferred for taking pictures of color documents, such as ID cards, especially when the imager is in a stand. LED illumination (1L) is preferred when the imager is hand held. LED State is not available when using Decoding Style.
  - 0L LEDs off (default)
  - 1L LEDs on
- T Wait for Trigger: Waits for a hardware trigger pull before taking the image.
  - OT Takes image immediately (default)
  - 1T Waits for a trigger pull, then takes the image
- **U Update Tries:** The maximum number of frames the imager should take to reach the Delta for Acceptance. Update Tries is only available when using Photo Style. (Default = 6)
  - *n*U Range: 0 10
- **W Target White Value:** Sets the target for the median grayscale value in the captured image. For capturing close-up images of high contrast documents, a lower setting, such as 75, is recommended. Higher settings result in longer exposure times and brighter images, but if the setting is too high, the image may be overexposed. Target White Value is only available when using Photo Style. (*Default = 125*)
  - *n*W Range: 0 255
- % Target Set Point Percentage: Sets the target point for the light and dark values in the captured image. A setting of 75% means 75% of the pixels are at or below the target white value, and 25% of the pixels are above the target white value. Altering this setting from the default is not recommended under normal circumstances. To alter grayscale values, Target White Value should be used. (Default = 50)
  - n% Range: 1 99

#### Image Ship - IMGSHP

An image is taken whenever the trigger of the IT4600/4800 is pressed, or when the Image Snap (IMGSNP) command is processed. The last image is always stored in memory. You may "ship" the image by using the IMGSHP command.

The image ship command has many different modifiers that can be used to change the look of the image output by the scanner. Modifiers affect the image that is transmitted, but do not affect the image in memory. Modifiers always begin with numbers and end with a letter (case insensitive). Any number of modifiers may be appended to the IMGSHP command. For example, you can use the following command to ship a bitmap image with gamma correction and document image filtering:

#### IMGSHP8F75K26U

#### **IMGSHP** Modifiers

- **A Infinity Filter:** Enhances pictures taken from very long distances (greater than 10 feet or 3 m).
  - 0A Infinity filter off (default)
  - 1A Infinity filter on
- **C Compensation:** Flattens the image to account for variations in illumination across the image.
  - 0C Compensation disabled (default)
  - 1C Compensation enabled
- **D Pixel Depth:** Indicates the number of bits per pixel in the transmitted image (KIM or BMP format only).
  - 8D 8 bits per pixel, grayscale image (default)
  - 1D 1 bit per pixel, black and white image
- **E Edge Sharpen:** Causes the transmitted image to be convolved with an edge sharpening filter. Entering a 23E gives the sharpest edges, but also increases noise in the image.
  - 0E Don't sharpen image (default)
  - 14E Apply edge sharpen for typical image
  - *n*e Apply edge sharpen using strength n (n = 1-24)
- **F File Format:** Indicates the desired format for the image.
  - 0F KIM format
  - 1F TIFF binary
  - 2F TIFF binary group 4, compressed
  - 3F TIFF grayscale
  - 4F Uncompressed binary (upper left to lower right, 1 pixel/bit, 0 padded end of line)
  - 5F Uncompressed grayscale (upper left to lower right, bitmap format)
  - 6F JPEG image (default)
  - 8F BMP format (lower right to upper left, uncompressed)

- **H Histogram Stretch:** Increases the contrast of the transmitted image. Not available with some image formats.
  - 0H No stretch (default)
  - 1H Histogram stretch
- **I Invert Image:** Used to rotate the image around the X or Y axis in fixed mount applications where the imager is mounted upside down.
  - 1IX Invert around the X axis (flips picture upside down)
  - 1IY Invert around the Y axis (flips picture left to right)
- **IF- Noise Reduction:** Used to reduce the salt and pepper noise.
  - OIF No salt and pepper noise reduction (default)
  - 1IF Salt and pepper noise reduction

Note: You may enable the Salt and Pepper Noise Reduction option if you have Firmware 31205122-064 or greater. Refer to the Show Software Revision on page 11-2 for information on determining the firmware revision in your unit.

#### IR - Image Rotate:

- 1IR Rotate image 90 degrees to the right
- 2IR Rotate image 180 degrees (upside down)
- 3IR Rotate image 90 degrees to the left
- **J JPEG Image Quality:** Sets the desired quality when the JPEG image format is selected. Higher numbers result in higher quality, but larger files. Smaller numbers result in greater amounts of lossy compression, faster transmission times, lower quality, but smaller files. (*Default = 50*)
  - *n*J Image is compressed as much as possible while preserving quality factor of n (n = 0 100)
  - 0J worst quality (smallest file)
  - 100J best quality (largest file)
- **K Gamma Correction:** Gamma measures the brightness of midtone values produced by the image. You can brighten or darken an image using gamma correction. A higher gamma correction yields an overall brighter image. The lower the setting, the darker the image. A setting of 100 results in no adjustment to the image. The optimal setting for text images is 50K.
  - OK Gamma correction off (default)
  - 50K Apply gamma correction for brightening typical document image
  - *n*K Apply gamma correction factor n (n = 1-255)

- **L, R, T, B, M Image Cropping:** Ships a window of the image by specifying the left, right, top, and bottom pixel coordinates. Device columns are numbered 0 through 640, and device rows are numbered 0 through 480.
  - *n*L The left edge of the shipped image corresponds to column n of the image in memory. Range: 000 640. (Default = 0)
  - nR The right edge of the shipped image corresponds to column n 1 of the image in memory. Range: 000 640. (Default = all columns, or 639 for VGA imager)
  - *n*T The top edge of the shipped image corresponds to row *n* of the image in memory. Range: 000 480. (*Default* = 0)
  - nB The bottom edge of the shipped image corresponds to row n 1 of the image in memory. Range: 000 480. (Default = all rows, or 479 for VGA imager)

Alternately, specify the number of pixels to cut from the outside margin of the image; thus only the center pixels are transmitted.

- *n*M Margin: cut *n* columns from the left, n + 1 columns from the right, n rows from the top, and n + 1 rows from the bottom of the image. Ship the remaining center pixels. Range: 1 238. (Default = 0, or full image)
- **P-Protocol:** Used for shipping an image. Protocol covers two features of the image data being sent to the host. It addresses the protocol used to send the data (Hmodem, which is an Xmodem 1K variant that has additional header information), and the format of the image data that is sent.
  - OP None (raw data)
  - 2P None (default for USB)
  - 3P Hmodem compressed (default for RS-232)
  - 4P Hmodem
- **S Pixel Ship:** Can be used to decimate the image by shipping only certain, regularly spaced pixels. For example, **4S** would transmit every fourth pixel from every fourth line. The smaller number of pixels shipped, the smaller the image. However, after a certain point, the image becomes unusable.
  - 1S ship every pixel (default)
  - 2S ship every 2nd pixel, both horizontally and vertically (default)
  - 3S ship every 3rd pixel, both horizontally and vertically
- **U Document Image Filter:** Sharpens the edges and smooths the area between the edges of the transmitted text image. The Document Image Filter enhances images of documents such as ID cards and prescriptions. This filter should be used with gamma correction (see page 8-4), with the imager in a stand, and the image captured using the command:

#### IMGSNP1P0L168W90%32D

This filter typically provides better JPEG compression than the standard E - Edge Sharpen command (see page 8-6). This filter also works well when shipping pure black and white images (1 bit per pixel). The optimal setting is 26U.

OU Document image filter off (default)

26U Apply document image filter for typical document image

nU Apply document image filter using grayscale threshold n. Use lower numbers when the image contrast is lower. 1U will have a similar effect to 22e. Range: 0-255.

**V - Blur Image:** Smooths transitions by averaging the pixels next to the hard edges of defined lines and shaded areas in an image.

0V Don't blur (default)

1V Blur

**W - Histogram Ship:** A histogram gives a quick picture of the tonal range of an image, or key type. A low-key image has detail concentrated in the shadows; a high-key image has detail concentrated in the highlights; and an average-key image has detail concentrated in the midtones. This modifier ships the histogram for an image.

0W Don't ship histogram (default)

1W Ship histogram

## Image Size Compatibility

If you prefer that an image ship returns images at the sensor's native resolution (752x480 pixels for the IT5X00 engine, 640x480 pixels for the IT4X00 engine), scan the Native Resolution code. If you have an IT4X00 image engine and have designed applications that expect an image ship to return exactly 640x480 pixels, scan the Force VGA Resolution bar code. Refer to "Show Engine Revision" on page 11-1 for information on determining the engine in your unit.

\* Force VGA Resolution

Native Resolution

Default = Force VGA Resolution

## Intelligent Signature Capture - IMGBOX

Note: IMGBOX commands can only be used with PDF417, Code 39, Code 128, Aztec, Codabar, and Interleaved 2 of 5 symbologies.

Intelligent signature capture ships only part of an image to the host application. This method reduces transfer time and file size, while simplifying signature capture.

Below is an example of an intelligent signature capture application. In this example, the operator reads the bar code, which is then transmitted to the host application. Upon the receipt of the bar code data, the host application sends the IMGBOX command, which tells the scanner to output only the area of the image corresponding to the signature capture box. The scanner also automatically adjusts for aspect ratio and distortion, issues that arise due to scanner skew with respect to the bar code.

Align the aimers with the signature area (not with the bar code), then pull the trigger. Send the IMGBOX command string after the trigger pull.

An important aspect of intelligent signature capture is that all dimensions used in the application are measured as multiples of the minimum element size of the bar code. Using this method, intelligent signature capture always outputs the correct image size and resolution, no matter the distance at which the scanner is held from the bar code, assuming that the entire signature capture area is within the scanner's field of view.

The intelligent signature capture command string for this application is:

#### IMGBOX40S0X70Y190W100H1R0F

## IMGBOX Modifiers

- **A Output Image Width:** This option is used to output an image of a particular width. If using this option, set the resolution to zero.
- **B Output Image Height** This option is used to output an image of a particular height. If using this option, set the resolution to zero.
- **D Pixel Depth:** Indicates the number of bits per pixel in the transmitted image.
  - 8D 8 bits per pixel, grayscale image
  - 1D 1 bit per pixel, black and white image

- **F File Format:** Indicates the type of file format in which to save the image.
  - 0F KIM format (default)
  - 1F TIFF binary
  - 2F TIFF binary group 4, compressed
  - 3F TIFF grayscale
  - 4F Uncompressed Binary
  - 5F Uncompressed grayscale
  - 6F JPEG image
  - 7F Outlined image
  - 8F BMP format
- **H Height of Signature Capture Area:** In the example, the height of the area to be captured is 1 inch, resulting in a value of H = 1/0.01 = 100. The value for H is slightly larger, to accommodate some extra image capture area outside of the signature capture box.
- **K Gamma Correction:** Gamma measures the brightness of midtone values produced by the image. You can brighten or darken an image using gamma correction. A higher gamma correction yields an overall brighter image. The lower the setting, the darker the image. A setting of 100 results in no adjustment to the image. (*Default = 50K*)
  - 0K Gamma correction off
  - 50K Apply gamma correction for brightening typical document image
  - *n*K Apply gamma correction factor n (n = 1-255)
- **R Resolution of Signature Capture Area:** The number of pixels that the imager outputs per each minimum bar width. The higher the value for R, the higher the quality of the image, but also the larger the file size. To specify a non-integer value for the resolution, use a number greater than or equal to 1000. For example, use 2500 to specify a resolution of 2.500. The imager automatically inserts a decimal point between the first and second digit. Set to zero when using the A and B modifiers.
- **S Bar Code Aspect Ratio:** The ratio of the bar code height to the narrow element width. In the example, the narrow element width is .010 inches and the bar code height is 0.400 inches, resulting in a value of S = 0.4/0.01 = 40.
- **W Width of Signature Capture Area:** In the example, the width of the area to be captured is 1.90 inches, resulting in a value of W = 1.9/0.01 = 190. The value for W is slightly larger, to accommodate some extra image capture area outside of the signature capture box.
- **X Horizontal Bar Code Offset:** The horizontal ratio offset of the center of the signature capture area, in multiples of the minimum bar width. In the example, the horizontal offset is 0.
- **Y Vertical Bar Code Offset:** The vertical offset of the center of the signature capture area, in multiples of the minimum bar width. Negative numbers indicate that the signature capture is above the bar code, and positive numbers indicate that the area is below the bar code. In the example, the horizontal offset is 0.70 inches, resulting in a value for Y = 0.7/0.01 = 70.

## OCR Programming

Use this section to program the Imager for optical character recognition (OCR). The 2D IT4600/4800 reads 6 to 60 point OCR typeface.

Note: OCR is not as secure as bar codes. To enhance security in OCR applications, create an OCR template to match the data, and print an OCR check character.

The 2D IT4600/4800 will read OCR-A, OCR-B, U.S. Currency Serial Number (Money), MICR E-13B, and SEMI Font.

You can either select an OCR default, or create your own custom template for the type of OCR format you intend to read. See "OCR" on page 9-1 for programming codes that will enable your imager to read OCR-A, OCR-B, U.S. Currency, MICR E 13 B, or SEMI fonts. See "OCR Templates" on page 9-3 if you want to create a custom "template," or character string that defines the length and content of OCR strings that will be read with your imager.

Note: Setting the template and check character options are essential for OCR reading.

#### OCR Fonts

Default All OCR Settings turns off all OCR capability in the imager, so the imager will be able to scan linear, stacked, matrix, and composite bar codes, but not OCR fonts. In addition, any OCR templates you have created are erased. The eight digit default templates are reinstated for any future use of the OCR On codes listed below.

< Default All OCR Settings >

#### OCR

Note: OCR symbols can misread when scanned sideways or upside down. Use Working Orientation, page 3-20, if your OCR symbols will not usually be presented upright to the scanner.

Only one OCR symbology can be read at a time.

OCR-A On allows you to scan characters in the OCR-A font. The default setting allows you to scan any eight digit combination. If you have created an OCR template, character combinations that fit the template can be scanned (see Creating an OCR Template, page 9-3).

**OCR-B On** allows you to scan characters in the OCR-B font. The default setting allows you to scan any eight digit combination. If you have created an OCR template, character combinations that fit the template can be scanned (see Creating an OCR Template, page 9-3).

OCR-B On

## U.S. Currency Font

**U.S. Currency On** allows you to scan characters in the font used on U.S. currency. The default setting allows you to scan any eight digit combination. If you have created an OCR template, character combinations that fit the template can be scanned (see Creating an OCR Template, page 9-3).

U.S. Currency On

#### MICR E13 B Font

**MICR E13 B On** allows you to scan MICR characters on a bank check. The default setting allows you to scan any eight digit combination. If you have created an OCR template, character combinations that fit the template can be scanned (see Creating an OCR Template, page 9-3).

MICR E 13 B On

Note: TOAD characters (Transit, On Us, Amount and Dash) are output in the following manner:

- the transit character is output as **T**
- the amount character is output as A
- II the on us character is output as O
- the dash character is output as D

#### SEMI Font

**SEMI Font On** allows you to scan the SEMI font used in the semiconductor industry.

SEMI Font On

**All OCR Off** turns off all OCR capability in the imager, so the imager will be able to scan linear, stacked, matrix, and composite bar codes, but not OCR fonts. However, any OCR templates you have created will be retained in memory.

\* All OCR Off

## **OCR** Templates

You can create a custom "template," or character string that defines the length and content of OCR strings that will be read with your imager. There are several choices when creating a custom template for your application. You can create a template for a single format, you can string together several formats, and you can create a template for a user-defined variable. These choices are described in detail below.

## Creating an OCR Template

A single template allows you to program the imager to read any combination of characters in the order you specify. Refer to examples that follow the Template Characters table below.

## Template Characters

| а            | represents any alphanumeric character (digit or letter)           |  |  |
|--------------|---|--|--|
| С            | represents that a check character is verified but not transmitted |  |  |
| d            | represents any digit  |  |  |
| е            | represents any available OCR character                            |  |  |
| g            | represents character from user-defined variable "g"               |  |  |
| h            | represents character from user-defined variable "h"               |  |  |
| i            | represents character from user-defined variable "g" or "h"        |  |  |
| k            | represents that a check character is verified but transmitted     |  |  |
| I            | represents any uppercase letter                                   |  |  |
| t            | marks the start of a new template                                 |  |  |
| r            | multi row indicator   |  |  |
| All other ch | All other characters represent themselves. Chance can be used     |  |  |

All other characters represent themselves. Spaces can be used.

Note: In MICR E13 B templates, TOAD characters (capital letters T, O, A, and D), represent Transit, On Us, Amount, and Dash.

Note: OCR templates default to eight digits, no check character.

#### To Add an OCR Template

- 1. Turn on the OCR font you want to read (page 9-1).
- Begin building the template. Scan the *Enter OCR Template* symbol (page 9-13).
- Scan the characters for the string.
   Use the Template Characters chart above to determine what characters you need to create your format. Use the OCR Programming Chart (after the Sample Codes in the back of this manual) to scan the characters for your template.

**Example:** You need to read any combination of eight digits. The template would be:

#### ddddddd

To create this template, you would enable the OCR-A font. Scan the *Enter OCR Template* symbol (page 9-13), then scan the *d* from the OCR Programming Chart in the back of this manual eight times. Scan *Save OCR Template* (page 9-14). This would let you read any string of eight digits, for example:

37680981

#### **Character Match Sequences**

On the ASCII Conversion Chart (Code Page 1252), page A-4, find the Hex value that represents the character(s) you want to match. Use the Programming Chart (inside the back cover) to scan the numbers that represent these characters.

**Example:** You need to read three digits, three specific characters (ABC), three digits. The template would be:

hex codes for letters A, B, and C

To create this template, you would enable the OCR-A font. Scan the *Enter OCR Template* symbol (page 9-13). Scan the *d* from the OCR Programming Chart in the back of this manual three times. Then scan *414243* from the inside back cover (the hex characters for "A," "B," and "C"), and scan the *d* three more times. Scan *Save OCR Template*, page 9-14. This would let you read any string of three digits, "ABC," then any string of three digits, for example:

#### 551ABC983

#### Adding Spaces

You may also need to put spaces in your template.

**Example:** You need to read three digits, space, three specific characters (ABC), space, three digits. The template would be:

ddd2041424320ddd  $\downarrow$   $\downarrow$  hex code for a space

To create this template, you would enable the OCR-A font. Scan the *Enter OCR Template* symbol (page 9-13). Scan the *d* from the OCR Programming Chart in the back of this manual three times, then scan *2041424320* from the Programming Chart on the inside back cover (the hex characters for "space," "A," "B," "C," "space"). Scan the *d* three more times, then scan *Save OCR Template* (page 9-14). This would let you read any string of three digits, space, "ABC," space, then any string of three digits. For example:

#### 551 ABC 983

Note: If using Quick\*View to program, use the space bar to designate a space and not the hex value of 20.

 Exit OCR Template Editor Scan Save OCR Template to save your entries. Discard OCR Template exits without saving any OCR Template changes.

## Stringing Together Multiple Formats (Creating "Or" Statements)

You may want to program the imager to accept many OCR formats. To do this, you would string together each format with a "t." This tells the imager to read optical characters that match any one of the formats in the template.

**Example:** You need to read any combination of eight digits, *or* a combination of four digits, two uppercase letters, and two digits. The template would be:

#### dddddddddddlldd

To create this template, you would enable the OCR-A font. Scan the *Enter OCR Template* symbol (page 9-13). Scan the *d* from the OCR Programming Chart in the back of this manual eight times, then scan the *t* to create the "or" statement. Then you would scan the characters for the second template. Scan *d* four times, scan *I* two times, then scan *d* two more times. Scan *Save OCR Template* (page 9-14). This would let you read either type of format, for example:

99028650

or 9902XZ50

You can string together as many templates as you need.

## **OCR** User-Defined Variables

You can create up to two of your own user variables for an OCR template. These variables will represent any OCR readable characters. The user-defined variables are stored under the letters "g" and "h." Creating a user variable follows the same steps as creating a template, but instead of scanning the *Enter OCR Template* symbol, you scan the *Enter User-Defined Variable* symbol (page 9-13). The letters g and h can then be used in an OCR template to define the variable you specified.

**Example:** You need a variable to represent the letters "A," "B," or "C." The template for this variable would be:

#### 414243

To create this template, you would enable the OCR-A font. Scan the *Enter User-Defined Variable g* symbol (page 9-13). Scan *414243* from the Programming Chart (the hex characters for "A," "B," and "C"). Scan *Save OCR Template* (page 9-14). This will let you read either A or B or C in any position where you place the g. For example, you could create the following template:

ddddddggg

This template would then let you read data that began with six digits, and had an A, B, or C trailing. So you would be able to read:

654321ABC

*or* 654321BAC

or 654321CCC

#### Reading Multi-Row OCR

The IT4600/4800 is capable of decoding multi-row OCR text.

Note: Reading rows longer than sixteen characters is not recommended.

Consider the following example. This example shows serial commands as they would be entered using Quick\*View.

**Example:** You need to read multiple rows of OCR-A data as shown below:

12345678

ABCDEFGH

First, enable the OCR-A font. To read the first row of OCR data, you would program the following template:

OCRTMP"dddddddd".

This template is the default OCR template. If you wanted to read the second line of data, you would use the following template:

OCRTMP"IIIIIII".

To read both lines of OCR at one time, use the variable r to indicate the start of a new row. All the other templating variables for the individual rows work the same as previously described. For instance, in the above example, you would use the following template to read both rows:

OCRTMP"ddddddddrllllllll".

To read the three rows below, you would use the template command "OCRTMP"ddddddddrllllllllllllllldddd".

12345678

**ABCDEFGH** 

ABCD1234.

#### OCR Check Character

You may want to print and verify a check character in order to enhance the security of your OCR application. The IT4600/4800 can be programmed for almost any type of check character. A number of presets are provided for common check character uses (e.g., modulo 10 and modulo 36).

Scan the *OCR Modulo 10* or *OCR Modulo 36 Check Character* bar code to specify the type of check character used in the OCR strings you're scanning. The imager will then only read OCR character strings with a valid check character. The IT4600/4800 transmits the OCR data without the check character data. You must specify the location of the check character in the template with a *c*.

**Example:** You need to read any combination of seven digits, with a modulo 10 check character in the eighth position. The template would be:

#### ddddddc

To create this template, you would enable the OCR-A font. Scan the *Modulo 10 Check Character* symbol. Then scan the *Enter OCR Template* symbol, and scan the *d* from the OCR Programming Chart seven times, and scan the *c* once. Scan *Save OCR Template* (page 9-14). This template will let you read any combination of six digits with a correct check character after. (If the check character is invalid, the imager will issue an error beep.) For example, the following string could be scanned:

#### 01234569

and the output would be: 0123456

#### OCR Modulo 10 Check Character

Scan this symbol to program the OCR template for a simple modulo 10 checksum of the digits 0 through 9.

OCR Modulo 10 Check Character

#### OCR Modulo 36 Check Character

Scan this symbol to program the OCR template for a simple modulo 36 checksum of the digits 0 through 9 and the letters A through Z.

OCR Modulo 36 Check Character

## OCR User-Defined Check Character

You can customize the check character calculation to suit your application. Each character of the check character alphabet can be programmed in its proper order. The number of characters you enter determines the modulo value for the calculation. By default, the check character computation is unweighted, but the imager also supports two weighted modulo 10 checking schemes.

**Example:** To program a modulo 11 check character, you would enter the following 11 characters in order:

#### 0123456789X

Also enter the OCR template:

#### ddddddc

Enable the OCR-A font, then scan the following string:

#### 6515321X

The imager performs the following check character computation:

$$(6+5+1+2+3+5+1+X)$$
 modulo  $11=0$ 

Since the result is zero, the message is considered to be valid, so the reader outputs the message: 6512351

## Programming a User-Defined Check Character

1. Scan the Enter OCR Check Character bar code, below.

Enter OCR Check Character

- Enter the characters in order. For each character, look up the corresponding hex value from the ASCII Conversion Chart (Code Page 1252) on page A-4. Use the Programming Chart on the inside the back cover of this manual to scan the two symbols for each hex value.
- 3. Scan the **Save** bar code on the inside back cover.

Example: To program the modulo 11 check character from example #8 on page 9-9, enable the OCR-A font. Scan the Enter OCR Check Character bar code on page 9-9, then scan the following hex values in order:

#### 3031323334353637383958

After you enter all the desired hex values, scan the **Save** bar code on the inside back cover of this manual.

## Weighting Options

By default, the check character computation is unweighted. It is possible to use one of two weighted modulo 10 schemes. Weighting is often used to detect if two neighboring characters are transposed, a common error when an operator keys in data.

#### 3-1-3-1 Weighted Modulo 10 Check Character

Starting with the check character and working backward through the message, the imager applies a multiplier of 1, then 3, then 1, then 3, and so on. This is the checking scheme used in many EAN•UCC symbologies, including U.P.C. and Interleaved 2 of 5 (when a check digit is invoked). To apply this weighting scheme, set the OCR check character to "0123456789x3x1" or scan the following symbol:

3-1-3-1 Weighted Modulo 10 Check Character

**Example:** Scan the 3-1-3-1 Weighted Modulo 10 Check Character symbol. Also enter the OCR template:

ddddddc

Then scan the string below:

01234565

The reader performs the check character computation below:

 $(0 \times 3 + 1 \times 1 + 2 \times 3 + 3 \times 1 + 4 \times 3 + 5 \times 1 + 6 \times 3 + 5 \times 1)$  modulo 10 = 0

Since the result is zero, the message is considered to be valid, so the reader outputs the message: 0123456

#### 2-1-2-1 Weighted Modulo 10 Check Character

Starting with the check character and working backward through the message, the imager applies a multiplier of 1, then 2, then 1, then 2, and so on. When the result of the multiplication is greater than 9, add both digits to the running sum. This is often referred to as the LUHN formula. One common application of the LUHN formula is validate credit card numbers. This is the modulo 10 checking scheme used in MSI Code and in Code 32 Pharmaceutical (PARAF). To apply this weighting scheme, set the OCR check character to "0123456789x2x1" or scan the following symbol:

2-1-2-1 Weighted Modulo 10 Check Character

**Example:** Scan the 2-1-2-1 Weighted Modulo 10 Check Character symbol. Also enter the OCR template:

ddddddc

Then scan the string below:

0128454

The reader performs the check character computation below:

$$(0 \times 1 + 1 \times 2 + 2 \times 1 + 8 \times 2 + 4 \times 1 + 5 \times 2 + 4 \times 1)$$
 modulo 10  
=  $(0 + 2 + 2 + (1 + 6) + 4 + (1 + 0) + 4)$  modulo 10  
= 0

Since the result is zero, the message is considered to be valid, so the reader outputs the message: 012845

## OCR ISBN Application Example

One application of OCR is to read the ISBN characters typically encoded using the OCR-A or OCR-B font. This is especially useful when the ISBN number is not encoded in an EAN-13 bar code. The following example shows how to configure the imager to read the ISBN strings on books in Japan. After you have followed the steps below, you will be able to scan the following ISBN number or the additional data below it, depending on the line of text at which the imager is aimed.

#### C0097 ¥838E

- Scan the OCR-B On bar code on page 9-2.
- Program the user-defined variable "g" to comprise the ten digits plus the dash:

#### 0123456789-

3. In Japan, it is common for two fields to follow the ISBN number, the three digit price field, and the four digit price field. The first field typically starts with a "C" (uppercase c), followed by four digits. The second field typically starts with a "P" or a yen symbol, followed by three or four digits, followed by an "E." Program the user-defined variable "h" to comprise the "P" and the yen symbol (represented by a backslash).

P١

4. Scan the symbol below to set up three templates to handle the ISBN number, the three digit price field, and the four digit price field.

- Finally, set up the ISBN check digit, which is a special position-weighted modulo 11 checksum. The imager automatically invokes the ISBN checksum for template rows that are:
  - 1.) at least fourteen characters long,
  - 2.) whose first four characters are the letters "ISBN,"
  - 3.) whose last character is a check character, and
  - 4.) when the modulo 11 check character "0123456789X" is programmed.

Please note that all these commands can be combined into a single serial programming command:

OCRENA2, TMP" ISBN ggggggggggggctCdddd hddd EtCdddd hddd E', GPG" 0123456789-", GPH" P", CHK" 0123456789X".

These commands can be encoded into the following Aztec Code symbol:

## **OCR Template Codes**

Note: Reading more than three rows of OCR is not recommended. Contact the factory if you have an application that requires reading four or more rows of OCR.

Enter OCR Template †

Variable "h"†

Enter User-Defined Variable "g"†

† One or more two-digit numbers and *Save* are required after reading this programming symbol. Refer to the Programming Chart on the inside the back cover of this manual.

## **Exit Selections**

Save OCR Template

## **Interface Keys**

## **Keyboard Function Relationships**

The following Keyboard Function Code, Hex/ASCII Value, and Full ASCII "CTRL"+ relationships apply to all terminals that can be used with the imager. Refer to page 2-7 enable Control + ASCII mode.

| <b>Function Code</b> | <b>HEX/ASCII Value</b> | Full ASCII "CTRL" + |
|----------------------|------------------------|---------------------|
| NUL                  | 00                     | 2                   |
| SOH                  | 01                     | Α                   |
| STX                  | 02                     | В                   |
| ETX                  | 03                     | С                   |
| EOT                  | 04                     | D                   |
| ENQ                  | 05                     | E                   |
| ACK                  | 06                     | F                   |
| BEL                  | 07                     | G                   |
| BS                   | 08                     | Н                   |
| HT                   | 09                     | 1                   |
| LF                   | 0A                     | J                   |
| VT                   | 0B                     | K                   |
| FF                   | 0C                     | L                   |
| CR                   | 0D                     | M                   |
| SO                   | 0E                     | N                   |
| SI                   | 0F                     | Ο                   |
| DLE                  | 10                     | Р                   |
| DC1                  | 11                     | Q                   |
| DC2                  | 12                     | R                   |
| DC3                  | 13                     | S                   |
| DC4                  | 14                     | Т                   |
| NAK                  | 15                     | U                   |
| SYN                  | 16                     | V                   |
| ETB                  | 17                     | W                   |
| CAN                  | 18                     | X                   |
| EM                   | 19                     | Υ                   |
| SUB                  | 1A                     | Z                   |
| ESC                  | 1B                     | [                   |
| FS                   | 1C                     | \                   |
| GS                   | 1D                     | ]                   |
| RS                   | 1E                     | 6                   |
| US                   | 1F                     | -                   |

The last five characters in the Full ASCII "CTRL"+ column ([\]6 -), apply to US only. The following chart indicates the equivalents of these five characters for different countries.

| Country        |   |   | Codes |   |   |
|----------------|---|---|-------|---|---|
| United States  | [ | \ | ]     | 6 | - |
| Belgium        | [ | < | ]     | 6 | - |
| Scandinavia    | 8 | < | 9     | 6 | - |
| France         | ^ | 8 | \$    | 6 | = |
| Germany        |   | Ã | +     | 6 | - |
| Italy          |   | \ | +     | 6 | - |

# 11 Utilities

## To Add a Test Code I.D. Prefix to All Symbologies

This selection allows you to turn on transmission of a Code I.D. before the decoded symbology. (See the Symbology Chart, included in the Appendix A, page A-1) for the single character code that identifies each symbology.) This action first clears all current prefixes, then programs a Code I.D. prefix for all symbologies. This is a temporary setting that will be removed when the unit is power cycled.

Add Code I.D. Prefix to All Symbologies (Temporary)

#### Show Decoder Revision

Scan the bar code below to output the decoder revision.

Note: You may use the Show Decoder Revision option if you have Firmware 31205122-064 or greater. Refer to the Show Software Revision on page 11-2 for information on determining the firmware revision in your unit.

Show Decoder Revision

## Show Engine Revision

Note: You may use the Show Engine Revision option if you have Firmware 31205122-064 or greater.

Scan the bar code below to output the engine revision. If your imager has an IT4X00 engine, it will return an [ACK] with no data in the string. If your imager has an IT5X00 engine, it will return the engine type, revision number, and status character [ACK]. For example, an imager with an IT5100, version 26 would return:

ENGREVType: 1 Revision: 26[ACK]

Show Engine Revision

#### Show Scan Driver Revision

Scan the bar code below to output the scan driver revision. The scan driver controls image capture.

You may use the Show Scan Driver Revision option if you have Firmware 31205122-064 or greater. Refer to the Show Software Revision on page 11-2 for information on determining the firmware revision in your unit.

Show Scan Driver Revision

## Show Software Revision

Scan the bar code below to output the current software revision, unit serial number, and other product information.

Show Software Revision

## Show Data Format

Scan the bar code below to show current data format settings.

**Data Format Settings** 

## Resetting the Standard Product Defaults

If you aren't sure what programming options are in your imager, or you've changed some options and want the standard product default settings restored, scan the **Standard Product Default Settings** bar code below.

Standard Product Default Settings

The Menu Commands starting on page 12-5 lists the standard product default settings for each of the commands (indicated by an asterisk (\*) on the programming pages).

#### Test Menu

When you scan the Test Menu *On* code, then scan a programming code in this manual, the imager displays the content of a programming code. The programming function will still occur, but in addition, the content of that programming code is output to the terminal.

Note: This feature should not be used during normal imager operation.

## 2D PQA (Print Quality Assessment)

Two-dimensional Print Quality Assessment (2D PQA) is a feature of Hand Held Products' image readers where the data from the successful read of a 2D bar code symbol is augmented with lines of text that both identify the symbol, and also report graded measurement parameters obtained from it.

#### 2D PQA Reporting

Hand Held Products' 2D PQA reporting can be enabled in two different modes: Full Report or Screening. (To see displayed results, Microsoft® Notepad, a word processor/editing program, or Quick\*View (page 11-6) is recommended.)

If you are using Quick\*View, you can enable Full Report, a listing of all of a symbol's identifying information, measurements, and corresponding grades, by typing the following menu command:

2D PQA1

or by scanning the following bar code:

Note: With the IT4600/4800, the PQA report is sent out as a second data/beep sequence after the bar code data. The report has its own Hand Held Products code ID of >(0X3E) so it can be uniquely identified.

You can exit Full Report mode by either typing the menu command, 2D\_PQA0, if you are using Quick\*View, or by scanning the following bar code:

For additional information on interpreting your read results, please refer to Hand Held Products' Quick Check 2D Print Assessment User's Guide.

#### Visual Menu 2003

Visual Menu 2003 provides the ability to configure an imaging device by connecting the imager to the COM port of a PC. Visual Menu 2003 allows you to download updates to an imager's firmware, change programmed parameters, and create and print programming bar codes. Using Visual Menu 2003, you can even set up the configuration for an imager which is not attached to your PC. This enables one expert user to establish the configuration settings for all the devices your company uses, then save these configuration files for others. A configuration file can be e-mailed or, if you prefer, an expert user can create a bar code (or series of bar codes) which contains all the customized programming parameters, and mail or fax the bar code(s) to any location. Users in other locations can scan the bar code(s) to load in the customized parameters.

To communicate with an imager, Visual Menu 2003 requires that the PC have at least one available serial communication port and an RS-232 cable to connect the port to the device. A power supply, which plugs into the cable, is also required.

Note: If you already have a copy of Visual Menu, please note that older versions of Visual Menu will not work with the IT4600/4800. You must use Visual Menu 2003 with the IT4600/4800.

## Visual Menu 2003 Operations

The Visual Menu 2003 program performs the following operations:

- Displays all configuration data, and saves the information to a file on your PC.
- Configures the device to meet your specific requirements. Visual Menu 2003
  has all the programming parameters that are available via programming bar
  codes in this User's Guide.
- Creates and prints a clone bar code which contains the program and configuration data from one device. This bar code can then be used to program additional devices with the same parameters.

 Selects a device from a list, then performs offline or online file configuration for that device.

## Temporary Visual Menu 2003 Configuration

For quick download communication configuration, scan the **Visual Menu 2003** bar code to temporarily configure the imager for Visual Menu 2003 settings.

Note: If you have a unit capable of keyboard wedge mode, scan the bar code below and the unit will communicate in RS-232 mode, allowing it to work with Visual Menu 2003. To convert the imager back to keyboard wedge communication, cycle the power.

Visual Menu 2003

Note: If you download new software into a unit, the user-programmed parameters are retained. If you need to discard user-programmed settings, see Resetting the Standard Product Defaults on page 11-2.

## Installing Visual Menu 2003 from the Web

- 1. Access the Hand Held Products web site at www.handheld.com.
- 2. Click on the Search text box and enter Visual Menu 2003.
- 3. Click on Search. Select Software.
- 4. Click on Visual Menu 2003.
- When prompted, select Save File, and save the files to the c:\windows\temp directory.
- 6. Once you have finished downloading the file, exit the web site.
- 7. Using Explorer, go to the **c:\windows\temp** file.
- 8. Double click on the **Visualmenu2003.exe** file. Follow the screen prompts to install the Visual Menu 2003 program.
- To start Visual Menu 2003, from the Start Menu click on Programs, Visual Menu 2003, Visual Menu 2003.

Note: If you wish, you can create a shortcut to the Visual Menu 2003 executable on your desktop.

## Quick\*View

Quick\*View is a Microsoft Windows® program that displays decoded symbol messages and captures images (for instance, ID photographs) from the IMAGETEAM 4600/4800. Bar code information and images are displayed in the Quick\*View window.

## Installing Quick\*View from the Web

- 1. Access the Hand Held Products web site at www.handheld.com.
- 2. Click on Search and enter Quick\*View.
- 3. Click on Search.
- Click on the entry for Software. Select Quick\*View Software Utility.
- When prompted, select Save, and save the files to the c:\windows\temp directory.
- 6. Once you have finished downloading the file, exit the web site.
- 7. Using Explorer, go to the c:\windows\temp file.
- 8. Double click on the **Quickview.exe** file. Follow the screen prompts to install the Quick\*View program.
- To start Quick\*View, from the Start Menu click on Programs, Quick\*View, Quick\*View.

Note: If you wish, you can create a shortcut to the Quick\*View executable on your desktop.

## Temporary Quick\*View Configuration

For a quick download communication configuration, scan the Quick\*View bar code and the imager will be temporarily configured for Quick\*View settings.

Note: If you have a unit capable of keyboard wedge mode, scan the bar code below and the unit will communicate in RS-232 mode, allowing it to work with Quick\*View. To convert the imager back to keyboard wedge communication, cycle the power.

Ouick\*View

# 12

## **Serial Programming Commands**

The serial programming commands can be used in place of the programming bar codes. Both the serial commands and the programming bar codes will program the IT4600/4800. For complete descriptions and examples of each serial programming command, refer to the corresponding programming bar code in this manual.

The device must be set to an RS-232 interface (see page 1-9). The following commands can be sent via a PC COM port using terminal emulation software.

#### **Conventions**

The following conventions are used for menu and query command descriptions: parameterA label representing the actual value you should send as part of a command.

[option] An optional part of a command.

{Data} Alternatives in a command.

**bold** Names of menus, menu commands, buttons, dialog boxes, and windows that appear on the screen.

## Menu Command Syntax

Menu commands have the following syntax (spaces have been used for clarity only):

Prefix Tag SubTag {Data} [, SubTag {Data}] [; Tag SubTag {Data}] [...] Storage

Prefix Three ASCII characters: **SYN M CR** (ASCII 22.77.13).

Tag A 3 character case-insensitive field that identifies the desired menu

command group. For example, all RS-232 configuration settings

are identified with a Tag of 232.

SubTag A 3 character case-insensitive field that identifies the desired menu

command within the tag group. For example, the SubTag for the

RS-232 baud rate is BAD.

Data The new value for a menu setting, identified by the Tag and Sub-

Tag.

Storage A single character that specifies the storage table to which the

command is applied. An exclamation point (!) performs the command's operation on the device's volatile menu configuration table. A period (.) performs the command's operation on the device's non-volatile menu configuration table. Use the non-volatile table only for semi-permanent changes you want sayed through a power

cycle.

#### Query Commands

Several special characters can be used to query the device about its settings.

- Mhat is the default value for the setting(s).
- ? What is the device's current value for the setting(s).
- \* What is the range of possible values for the setting(s). (The device's response uses a dash (-) to indicate a continuous range of values. A pipe (I) separates items in a list of non-continuous values.)

#### Tag Field Usage

When a query is used in place of a Tag field, the query applies to the *entire* set of commands available for the particular storage table indicated by the Storage field of the command. In this case, the SubTag and Data fields should not be used because they are ignored by the device.

#### SubTag Field Usage

When a query is used in place of a SubTag field, the query applies only to the subset of commands available that match the Tag field. In this case, the Data field should not be used because it is ignored by the device.

#### **Data Field Usage**

When a query is used in place of the Data field, the query applies only to the specific command identified by the Tag and SubTag fields.

## Concatenation of Multiple Commands

Multiple commands can be issued within one Prefix/Storage sequence. Only the Tag, SubTag, and Data fields must be repeated for each command in the sequence. If additional commands are to be applied to the same Tag, then the new command sequence is separated with a comma (,) and only the SubTag and Data fields of the additional command are issued. If the additional command requires a different Tag field, the command is separated from previous commands by a semicolon (;).

#### Responses

The device responds to serial commands with one of three responses:

ACK Indicates a good command which has been processed.

**ENQ** Indicates an invalid Tag or SubTag command.

NAK Indicates the command was good, but the Data field entry was out of the allowable range for this Tag and SubTag combination, e.g., an entry for a minimum message length of 100 when the field will only accept 2 characters.

When responding, the device echoes back the command sequence with the status character inserted directly before each of the punctuation marks (the period, exclamation point, comma, or semicolon) in the command.

## Examples of Ouery Commands

In the following examples, a bracketed notation [ ] depicts a non-displayable response.

Example #1:What is the range of possible values for Codabar Coding Enable?

Enter: cbrena\*.

CBRENA0-1[ACK] Response:

This response indicates that Codabar Coding Enable (CBRENA) has a range of values from 0 to 1 (off and on).

Example #2: What is the default value for Codabar Coding Enable?

Enter: cbrena^.

Response: CBRENA1[ACK]

This response indicates that the default setting for Codabar Coding Enable (CBRENA) is 1, or on.

Example #3: What is the device's current setting for Codabar Coding Enable?

Enter: cbrena?.

CBRENA1[ACK] Response:

This response indicates that the device's Codabar Coding Enable (CBRENA) is set to 1, or on.

Example #4: What are the device's settings for all Codabar selections?

Enter: cbr?.

CBRENA1[ACK], Response:

SSX0[ACK], CK20[ACK]. CCT1[ACK], MIN2[ACK], MAX60[ACK]. DFT[ACK].

This response indicates that the device's Codabar Coding Enable (CBRENA) is set to 1, or on:

the Start/Stop Character (SSX) is set to 0, or Don't Transmit;

the Check Character (CK2) is set to 0, or Not Required; concatenation (CCT) is set to 1, or Enabled;

the Minimum Message Length (MIN) is set to 2 characters:

the Maximum Message Length (MAX) is set to 60 characters;

and the Default setting (DFT) has no value.

## **Trigger Commands**

You can activate and deactivate the imager with serial trigger commands. First, the imager must be put in Manual/Serial Trigger Mode either by scanning the Manual/Serial Trigger Mode bar code (page 3-4), or by sending the Manual/Serial Menu Command (page 12-9). Once the imager is in serial trigger mode, the trigger is activated and deactivated by sending the following commands:

Activate: SYN T CR

Deactivate: SYN U CR

The imager scans until a bar code has been read, until the deactivate command is sent, or until the serial time-out has been reached (see "Read Time-Out" on page 3-4 for a description, and the serial command on page 12-9).

## Resetting the Standard Product Defaults

If you aren't sure what programming options are in your imager, or you've changed some options and want the factory settings restored, scan the **Standard Product Default Settings** bar code below.

Standard Product Default Settings

The chart on the following pages lists the factory default settings for each of the menu commands (indicated by an asterisk (\*) on the programming pages).

# Menu Commands

# Standard Cable Pinouts Laser Output Only (Laser Compatible Bar Image)

Conventional laser data format is provided at the modular connector in the imager handle. The interface cable is terminated with a 10 pin modular plug, and a 9 pin Type D (squeeze to release) connector that s compatible with all IT46/4800's terminals.

◆ Pins 4 and 9 are populated depending on power supply voltage option.

# Standard Cable Pinouts

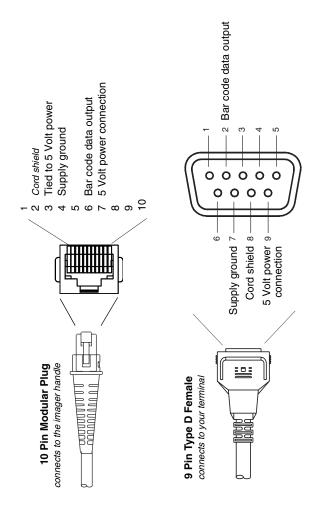

# Keyboard Wedge

10 Pin RJ41 Modular Plug connects to the imager handle

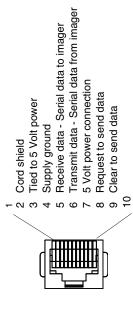

# Standard Cable Pinouts

# Wand Emulation

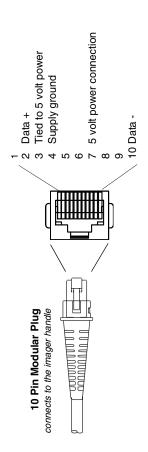

# Standard Cable Pinouts (Primary Interface Cables) Serial Output

10 Pin RJ41 Modular Plug connects to the imager handle

# Standard Cable Pinouts USB

# 14 Maintenance

# Repairs

Repairs and/or upgrades are not to be performed on this product. These services are to be performed only by an authorized service center. See "Customer Support" on page 15-1 for further information.

#### Maintenance

The IT4600/4800 provides reliable and efficient operation with a minimum of care. Although specific maintenance is not required, the following periodic checks ensure dependable imager operation:

# Cleaning the Imager's Window

Reading performance may degrade if the imager's window is not clean. If the window is visibly dirty, or if the imager isn't operating well, clean the window with a soft cloth or lens tissue dampened with water (or a mild detergent- water solution). If a detergent solution is used, rinse with a clean lens tissue dampened with water only.

The imager's housing may also be cleaned the same way.

Do not submerge the imager in water. Do not use abrasive wipes or tissues on the imager's window – abrasive wipes may scratch the window.

Never use solvents (e.g., acetone, benzene, ether, or phenol-based agents) on the housing or window – solvents may damage the finish or the window.

# **Inspecting Cords and Connectors**

Inspect the imager's interface cable and connector for wear or other signs of damage. A badly worn cable or damaged connector may interfere with imager operation. Contact your Hand Held Products distributor for information about cable replacement. Cable replacement instructions are on page 14-2.

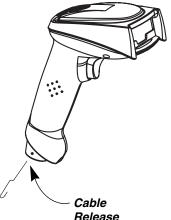

# Replacing the Interface Cable

The standard interface cable is attached to the imager with an 10-pin modular connector. When properly seated, the connector is held in the IT4600/4800 imager's handle by a flexible retention tab. The interface cable is designed to be field replaceable.

- Order replacement cables from IT4600/4800 or from an authorized distributor.
- When ordering a replacement cable, specify the cable part number of the original interface cable.

#### To Replace the IT4600 Interface Cable:

- Turn the power to the host system OFF.
- 2. Disconnect the imager's cable from the terminal or computer.
- Locate the small hole on the side of the imager's handle. This is the cable release.
- 4. Straighten one end of a paper clip.
- Insert the end of the paper clip into the small hole and press in. This depresses the retention tab, releasing the connector. Pull the connector out while maintaining pressure on the paper clip, then remove the paper clip.
- Replace with the new cable. Insert the connector into the opening and press firmly. The connector is keyed to go in only one way, and will click into place.

# To Replace the IT4800 Interface Cable:

- Turn the power to the host system OFF.
- 2. Disconnect the imager's cable from the terminal or computer.
- 3. Use a screwdriver to unscrew the cord lock from the base of the imager.
- Locate the small hole on the side of the imager's handle. This is the cable release.
- 5. Straighten one end of a paper clip.
- Insert the end of the paper clip into the small hole and press in. This depresses the retention tab, releasing the connector. Pull the connector out while maintaining pressure on the paper clip, then remove the paper clip.
- Replace with the new cable.
   Insert the connector into the opening and press firmly. The connector is keyed to go in only one way, and will click into place.
- 8. Screw the cord lock back in place over the cord.

The imager automatically performs self-tests whenever you turn it on. If your imager is not functioning properly, review the following Troubleshooting Guide to try to isolate the problem.

Is the power on? Is the red aiming illumination line on?

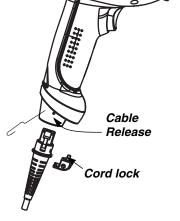

If the red aiming illumination line isn't illuminated, check that:

- The cable is connected properly.
- The host system power is on (if external power isn't used).
- The trigger works.

Is the imager having trouble reading your symbols?

If the imager isn't reading symbols well, check that the symbols:

- Aren't smeared, rough, scratched, or exhibiting voids.
- Aren't coated with frost or water droplets on the surface.
- Are enabled in the imager or in the decoder to which the imager connects.

Is the bar code displayed but not entered?

The bar code is displayed on the host device correctly, but you still have to press a key to enter it (the Enter/Return key or the Tab key, for example).

You need to program a suffix. Programming a suffix enables the imager to output the bar code data plus the key you need (such as "CR") to enter the data into your application. Refer to "Prefix/Suffix Overview" on page 4-1 for further information.

Does the imager read the bar code incorrectly?

If the imager reads a bar code, but the data is not displayed correctly on the host screen:

- The imager may not be programmed for the appropriate terminal interface. For example, you scan "12345" and the host displays "@es%."
  - Reprogram the imager with the correct Plug and Play or Terminal selection bar code. See Chapter 1 and Chapter 2.
- The imager may not be programmed to output your bar code data properly. For example, you scan "12345" and the host displays "A12345B."

Reprogram the imager with the proper symbology selections. See Chapter 7.

The imager won't read your bar code at all.

- Scan the sample bar codes in the back of this manual. If the imager reads the sample bar codes, check that your bar code is readable.
   Verify that your bar code symbology is enabled (see Chapter 7).
- 2. If the imager still can't read the sample bar codes, scan "All Symbologies" on page 7-2.

If you aren't sure what programming options have been set in the imager, or if you want the factory default settings restored, scan Standard Product Default Settings on page 12-4.

# 15 Customer Support

# **Product Service and Repair**

Hand Held Products provides service for all its products through service centers throughout the world. To obtain warranty or non-warranty service, return the unit to Hand Held Products (postage paid) with a copy of the dated purchase record attached. Contact the appropriate location below to obtain a Return Material Authorization number (RMA #) before returning the product.

#### **Limited Warranty**

Hand Held Products, Inc. ("Hand Held Products") warrants its products to be free from defects in materials and workmanship and to conform to Hand Held Products' published specifications applicable to the products purchased at the time of shipment. This warranty does not cover any Hand Held Products product which is (i) improperly installed or used; (ii) damaged by accident or negligence, including failure to follow the proper maintenance, service, and cleaning schedule; or (iii) damaged as a result of (A) modification or alteration by the purchaser or other party, (B) excessive voltage or current supplied to or drawn from the interface connections, (C) static electricity or electro-static discharge, (D) operation under conditions beyond the specified operating parameters, or (E) repair or service of the product by anyone other than Hand Held Products or its authorized representatives.

This warranty shall extend from the time of shipment for the duration published by Hand Held Products for the product at the time of purchase ("Warranty Period"). Any defective product must be returned (at purchaser's expense) during the Warranty Period to Hand Held Products' factory or authorized service center for inspection. No product will be accepted by Hand Held Products without a Return Materials Authorization, which may be obtained by contacting Hand Held Products. In the event that the product is returned to Hand Held Products or its authorized service center within the Warranty Period and Hand Held Products determines to its satisfaction that the product is defective due to defects in materials or workmanship, Hand Held Products, at its sole option, will either repair or replace the product without charge, except for return shipping to Hand Held Products.

EXCEPT AS MAY BE OTHERWISE PROVIDED BY APPLICABLE LAW, THE FOREGOING WARRANTY IS IN LIEU OF ALL OTHER COVENANTS OR WARRANTIES, EITHER EXPRESSED OR IMPLIED, ORAL OR WRITTEN, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

HAND HELD PRODUCTS, INC.'S RESPONSIBILITY AND PURCHASER'S EXCLUSIVE REMEDY UNDER THIS WARRANTY IS LIMITED TO THE REPAIR OR REPLACEMENT OF THE DEFECTIVE PRODUCT. IN NO EVENT SHALL HAND HELD PRODUCTS BE LIABLE FOR INDIRECT, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, AND, IN NO EVENT, SHALL ANY LIABILITY OF HAND HELD PRODUCTS ARISING IN CONNECTION WITH ANY PRODUCT SOLD HEREUNDER (WHETHER SUCH LIABILITY ARISES FROM A CLAIM BASED ON CONTRACT, WARRANTY, TORT, OR OTHERWISE) EXCEED THE ACTUAL AMOUNT PAID TO HAND HELD PRODUCTS FOR THE PRODUCT. THESE LIMITATIONS ON LIABILITY SHALL REMAIN IN FULL FORCE AND EFFECT EVEN WHEN HAND HELD PRODUCTS MAY HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH INJURIES, LOSSES, OR DAMAGES. SOME STATES, PROVINCES, OR COUNTRIES DO NOT ALLOW THE EXCLUSION OR LIMITATIONS OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION MAY NOT APPLY TO YOU.

All provisions of this Limited Warranty are separate and severable, which means that if any provision is held invalid and unenforceable, such determination shall not affect the validity of enforceability of the other provisions hereof. Use of any peripherals not manufactured/sold by Hand Held Products voids the warranty. This includes but is not limited to: cables, power supplies, cradles, and docking stations. Hand Held Products, Inc. extends these warranties only to the first endusers of the products. These warranties are nontransferable.

The limited duration of the warranty for the IMAGETEAM 4600 or IMAGETEAM 4800 is for five (5) years.

<sup>\*</sup> Only available by special order.

Note: "m" represents the AIM modifier character. Refer to International

Technical Specification, Symbology Identifiers, for AIM modifier character

details.

Note: Prefix/Suffix entries for specific symbologies override the universal (All

Symbologies, 99) entry.

Refer to Data Editing beginning on page 4-1 and Data Formatting beginning on page 5-1 for information about using Code ID and AIM ID.

#### ASCII Conversion Chart (Code Page 1252)

Note: This table applies to U.S. style keyboards. Certain characters may differ depending on your Country Code/PC regional settings.

#### Code Page Mapping of Printed Bar Codes

Code pages define the mapping of character codes to characters. If the data received does not display with the proper characters, it may be because the bar code being scanned was created using a code page that is different from the one the host program is expecting. If this is the case, select the code page with which the bar codes were created. The data characters should then appear properly.

Note: The Code Page option is available for Code 39, Code 93, and Code 128.

| Code Page   | Standard        | Description                               |
|-------------|-----------------|---|
| 1           | CP ISO646       |   |
| 2 (Default) | ISO 2022        | Automatic National Replacement Characters |
| 3           | CP Binary       |   |
| 82          | ISO 2022 11 Swe | Swedish Replacement Characters            |
| 83          | ISO 2022 69 Fra | French/Belgian Replacement Characters     |
| 81          | ISO 2022 25 Fra | French/Belgian Replacement Characters     |
| 84          | ISO 2022 11 Ger | German Replacement Characters             |
| 85          | ISO 2022 11 Ita | Italian Replacement Characters            |
| 86          | ISO 2022 11 Swi | Swiss Replacement Characters              |
| 87          | ISO 2022 11 UK  | British Replacement Characters            |
| 88          | ISO 2022 11 Dan | Danish Replacement Characters             |
| 89          | ISO 2022 11 Nor | Norwegian Replacement Characters          |
| 90          | ISO 2022 11 Spa | Spanish Replacement Characters            |
